6 BASELINE CONDITIONS

6.1 Biotic Environment

The biodiversity baseline study was developed on the properties of PARACEL company, which plans the construction and operation of a pulp manufacturing plant on the Paraguay River, designed based on the best available technologies, and managed by according to certified systems, both from the productive and socio-environmental point of view¹. The raw material (*Eucalyptus* spp.) will come from own plantations located mainly in Concepción Department and to a lesser extent, in Amambay Department. The plantations will be installed in a total of 19 properties, on areas that currently correspond to livestock use.

The study area is located within the Districts of Sargento José Félix López in Concepción Department and Bella Vista in Amambay Department, around 500 km from the capital city of Asunción, within the northeastern region of the Department of Concepción and belongs to the Aquidabán ecoregion (Res. SEAM Nº 614/13). Seven main sampling areas have been identified: Gavilán, Trementina, Soledad, San Liberato, Santa Teresa, Zapallo and Hermosa). The faunistic monitoring has been carried out systematically and according to a specific monitoring plan; the technical team has carried out a general survey, making it possible to create a list of species for the area as a biodiversity baseline. This information is based on a bibliographic compilation for the potential species to be present in the area and direct observations as a result of field sampling.

The study area is located mainly within the Cerrado ecoregion, which is ranked as Highest Priority at Regional Scale for conservation, based on an analytical system for evaluating the conservation status of the ecoregions (Dinerstein et al. 1995). In Paraguay, the Cerrado occupies relatively small discontinuous areas forming a mosaic pattern on a slightly undulating topography with sandy soils generally visible between the vegetation. It should be noted that, depending on the authors and the context, the Cerrado can be classified as an ecoregion, an ecosystem or a formation. For the purpose of this report, the formation of the Cerrado at a national level is classified under different ecoregions, due to the fact that there is no detailed study of its distribution (Marín et al. 1998, Basualdo & Soria 2002, Rolón et al. 2017).

In the case of this study area, the Cerrado converges with the contiguous Humid Chaco and Upper Paraná Atlantic Forest ecoregions resulting in the presence of a high level of characteristic transitional biodiversity of the main taxonomic groups, and which this study focuses on (plants, fish, amphibians, reptiles, birds and mammals), resulting from the interaction between the ecoregions and their convergence. Knowledge is scarce; however, in spite of this limitation, the region is widely recognized as an area of great importance for fauna due to its remarkable diversity, the presence of species that are either endemic or have a restricted distribution, as well as a considerable number of species that fall under one category of threat or another (Rojas et al., 2020; Critical Ecosystem Partnership Fund, 2017; Asociación Guyra Paraguay, 2004). To further this ecoregional complexity, the area is also influenced by wetlands.

The Paraná-Paraguay river and wetland system acts as a corridor for fauna and flora in a predominantly north-south direction, facilitating the dispersal of organisms from

¹ PARACEL. Terms of Reference 200907 PAR-IFC-TOR-BLS biodiversity. Pag. 1

tropical regions to temperate latitudes and from the coastal regions of the Río de la Plata estuary towards the Paraná River and its tributaries (Ringuelet 1975, Giraudo et al. 2004, Arzamendia 2006, Neiff et al. 2006). As a unique characteristic, this region harbors the southernmost distribution of the Cerrado biome, a global diversity hotspot (Myers et al., 2000), reaching into the departments of San Pedro, Canindeyú and Caaguazú in the Eastern region of Paraguay (PNP, 2013; SEAM, 2013).

The study area includes the four types of typical environments found within the Cerrado region; *Bosque Alto* (Tall Forest), *Cerradón*, *Campos Sucios* (Dirty Fields) and *Campos Limpios* (Clean Fields), which have undergone different degrees of alteration mainly as a result of livestock use. Influences from neighboring ecoregions such as the Humid Chaco and the Upper Paraná Atlantic Forest are also evident (Hayes et al. 1995). The presence of Chacoan plant communities is frequently evident by *Copernicia alba* (*karanda'y*) palm groves mixed with typical elements of the Cerrado. Where deeper and more complex soil types are found, tall forests or elements typical of the Upper Paraná Atlantic Forest appear. This mixture of species and landscapes, or rather, this zone of gradual transition results in a local enrichment effect since it creates an opportunity for the convergence and confluence of species that are unique to the individual ecoregions.

Based on the databases from three different sources on the species richness of Paraguay's ichthyofauna, the numbers range from 259 (www.fishbase.org) to 395 (www.faunaparaguay.com/fishlist.html), and up to 451 (www.guyra.org.py). Published studies estimate that there are between 129 (Ramlow, 1981), 189 (Mandelburger et al., 1996) and 298 species (Bertoni, 1939). According to the Koerber & Vera checklist (2017), a total of 307 species of fish were confirmed and listed, four of which are threatened and another four species are introduced exotics. Earlier studies on the ichthyofauna within the study area are scarce and superficial; however, Insaurralde (2012) mentions 37 species for the Aquidabán River, which is relevant considering that the Trementina Stream (*Arroyo Trementina*) is a tributary of this sub-basin. Other water courses of this sub-basin are Negla, Pitanoahaga and Napegue. Also, the Hermosa stream was sampled and this flows water northward into the Apa River.

Around 54 species of amphibians and 91 species of reptiles have been recorded within the study area (Brusquetti & Lavilla 2006, Caballero et al. 2016, Cacciali et al. 2016, Cacciali & Kohler 2018; Smith et al. 2012, Weiler et al. 2013), which represent 61% and 50% of the total number of species for each group present in the country, respectively. In Amambay and Concepción, for instance, there are recorded species of anurans that are not found in any other region of the country, such as *Physalaemus centralis*, *P. marmoratus*, *Leptodactylus furnarius*, *Rhinella scitula*, *Dendropsophus jimi*, *D. elianae*, among others, which suggests this area as an endemic center for anurans in Paraguay (Cabral et al. 2020). Furthermore, although it would seem that the reptiles were simply a sub-set of species from the Atlantic Forest (Cacciali & Ubila, 2016), there are also species exclusive to plant formations of the Cerrado region, such as *Norops meridionalis*, *Colobosaura modesta*, *Salvator duseni*, *Bothrops pauloensis*, among others (Cacciali et al. 2016), which gives the area an exclusive conservation relevance.

There are 464 species of birds that occur within the Cerrado area (65% of the national birdlife), of which 11 species are considered endemic to the Cerrado in Paraguay. Furthermore, a number of species of great importance, either as a result of their ecosystemic role or because of their level of threat in Paraguay, occur in the Cerrado

(*Crax fasciolata*, *Pipile cumanensis* g., *Rhea americana*, *Ara chloropterus*, *Ara ararauna* and *Anodorhynchus hyacinthinus*) (Silva 1997, Guyra Paraguay Sf).

Regarding the mammalian fauna, the study area has few taxonomic studies and systematic surveys throughout the region (Critical Ecosystem Partnership Fund 2017, Red Paraguaya de Conservación en Tierras Privadas, Guyra Paraguay and Conservation International 2008; Guyra Paraguay 2004). Furthermore, most of these surveys were carried out in areas set aside as reserves on private lands, which leaves vast extensions of territory unsurveyed. Some scientific collections exist and some specific scientific work has been carried out where mammal data has been presented for this area (Gamarra de Fox & Martin 1996, Lowen et al. 1996, Melquist 1984); however, most of data compiled on the fauna of the region has resulted from the work carried out during expeditions, casual observations, interviews and Rapid Ecological Assessments for the preparation of technical reports (MAG 1996, Macedo 1996, Altervida 2003, FMB 2004, NLT 2007, Rojas et al. 2020). Rumbo (2010) lists 66 species for the Cerrado in Paraguay, based exclusively on records published in academic articles and museum specimens.

The Guyra Paraguay Biodiversity Database (BDBGP) lists 96 species for the Cerrado (*Campos Cerrados*); this database also includes historical records, data gathered during rapid ecological assessments as well as unpublished observations, always maintaining a strict approach regarding the inclusion of records. Bearing in mind the convergence of other ecoregions, an extensive review of the knowledge regarding the mammalian fauna of the "Northern Block of the BAAPA (Upper Paraná Atlantic Forest)" carried out by Guyra Paraguay (2004) has been consulted, compiling information from more than 20 studies carried out in the region, including the southern part of the area of interest for this study as well as the northern part of the Humid Chaco in the Western Region of Paraguay. In this review, a list of 115 mammal species was compiled based on reliable records for the study area. Once the lists were combined and the taxonomy of the cited species updated, a list of 103 possible species for the study area was obtained, which represents 57% of the country's species.

In Paraguay, 181 species of mammals have been identified (Sancha et al., 2017), of which 24 species fall under some level of threat category at an international level, while 12 species are considered DD (data deficient) (IUCN, 2021). At a national level, 32 species fall under some level of threat category, 29 are considered with insufficient data and 2 are not evaluated (APM & SEAM, 2017). Among the possible species for this work, some are cited as being of special importance for conservation such as jaguar (*Panthera onca*), giant armadillo (*Priodontes maximus*), giant anteater (*Myrmecophaga tridactyla*), maned wolf (*Chrysocyon brachyurus*), tapir (*Tapirus terrestris*), lipped peccary (*Tayassu pecari*) and pampas deer (*Ozotoceros bezoarticus*). All these species have in common that they are mammals with very specific habitat requirements, are threatened at either a national or international level, are medium or large in size, and can be monitored, using them as "umbrella" or "flag" species to achieve conservation objectives for most of the mammalian communities in the region. In summary, the mammalian fauna of the region is little known, more than 50% of the country's species are listed as possible for the study area, and among these species there are some of special interest for conservation.

6.1.1 Protected Areas (nationally and internationally recognized)

Protected Wild Areas

The legal framework for natural resource conservation within protected areas in Paraguay was established by Law 352 on Protected Wildlife Areas ("Areas Silvestres Protegidas" - ASP in Spanish), approved in 1994, which created the National System of Protected Wildlife Areas of Paraguay (SINASIP) (Sienra et al., 2004).

In 2000, in response to a specific need to implement the subsystem of the private forest areas, three resolutions were enforced: Resolution 49, approving the methodology for the elaboration of Management Plans for Wildlife Areas protected by SINASIP; Resolution n.73, authorizing the National Registry of Protected Wildlife Areas of Paraguay; and Resolution 79, establishing the procedure for the legal creation of private domain protected areas (Sienra et al., 2004).

That same year, Law 1561 created the National Environmental System and the Secretariat of State for the Environment (SEAM), entities whose function or objective is the formulation of policies, coordination, supervision and execution of environmental actions and plans, programs and projects within the framework of the National Development Plan and related to the preservation, conservation, recombination and management of natural resources (Sienra et al., 2004). According to SINASIP, Paraguay's protected wildlife areas have three management categories:

Fully protection

National parks: Those natural areas with ecosystems that contain outstanding geomorphological features, as well as species representative of a natural region and that under protection are destined for research, education and tourism in nature.

Natural Monuments: Those areas that contain unique natural or cultural characteristics or features of outstanding cultural value and that under protection are intended for scientific research and recreation when conditions permit.

Flexible use

Wildlife Refuge: These are those preferably natural areas intended for the conservation of species and ecosystems through active management.

Protected landscapes: Those natural areas intended for the protection of land and water landscapes and recreation.

Reserves of Managed Resources: These are areas that make it possible to combine the conservation of biological diversity with the sustainable use of ecosystems and their components.

Biosphere Reserve: They are those areas that allow the constitution of a flexible use unit and allow the harmonious coexistence of different modalities of use and conservation, which include other categories of management inside its limits.

According to the Map of Protected Wildlife Areas in Paraguay (SINASIP/SEAM, 2007; DASP/DGPCB/SEAM, 2011) the country has 68 protected units, i.e. 27% of its territory is under some category of protection. In the department of Concepción, the protected areas are divided into the following categories:

Table 1 – Protected Wildlife Areas in Paraguay (SINASIP/SEAM, 2007; DASP/DGPCB/SEAM, 2011)

Categories (SINASIP*)		Law	Area (ha)
National Parks	National Park Serranía de San Luís	Decree 20,712	103,018
	National Park Serranía de San Luís	Decree 17,740	10,273
Private natural reserves	Natural Reserve Cerrados del Tagatiya	Decree 7,791	5,700
	Natural Reserve Tagatiya mi	Decree 10,396	33,789
Biosphere Reserves	Biosphere Reserve of the Cerrado del Río Apa**	Decree 14e431	267,836

Source: * SINASIP: "Sistema Nacional de Áreas Silvestres Protegidas del Paraguay", National System of Protected Wildlife Areas of Paraguay (2007); ** biosphere Reserve del Cerrado del Río Apa is inserted both in Departament of Concepción and Amambay (SEAM, DGECC, 2010).

In addition to the protected areas mentioned above in the study conducted by the World Database on Protected Areas (WDPA, 2017), the Department of Concepción has two other private natural reserves: Guayacán I, II and III and Arrecife. Although the department of Concepción has approximately 300,000 hectares of protected wildlife areas, both public and private, i.e. just over 15% of the total area of its territory, these are concentrated in the northern portion of the department.

Ramsar Convention

The Convention on Wetlands is the intergovernmental treaty that provides the framework for the conservation and wise use of wetlands and their resources. The Convention was adopted in the Iranian city of Ramsar in 1971 and entered into force in 1975. Since then, almost 90% of the UN member states, from all geographic regions of the world, have agreed to become "Contracting Parties", and it was ratified by Paraguay by Law 350/94 of February 2 (Dominguez, 2015).

This convention gives member countries the responsibility to develop and implement a plan to promote the conservation of wetlands included in the list of international importance and beyond the wise use of all wetlands in their territory. In this sense, it certifies the creation of nature reserves with the corresponding measures for their custody. In addition, the signatories are charged with promoting research and the exchange of data and publications related to wetlands and their fauna and flora (RAMSAR 2006 apud Domínguez, 2015).

Paraguay currently has 6 sites designated as Wetlands of International Importance (Ramsar sites), covering an area of 785,970 hectares (<https://www.ramsar.org/wetland/paraguay>):

Negro River (Ramsar nº. 729)

Located at 19°52'S and 58°34'W, on the border between Bolivia and Brazil, with a surface area of 370,000 ha it represents a river system of lakes and course located in an ecotone resulting from the confluence of three biogeographic provinces with a representative fauna.

Chaco Lodge Lagoon (Ramsar nº. 1330)

Located in Presidente Hayes, at 22°17'S and 59°18'W, it is a private reserve with 2,500 hectares of surface area. The Chaco Lodge is a salt water lake with marked level fluctuations, surrounded by xerophilic forests and bushes and halophilic vegetation, frequented by many species of birds.

Teniente Rojas Silva Lagoon (Ramsar nº. 1390)

Located in Boquerón at 22°38'S and 59°03'W, it is a private reserve with 8,470 ha of surface area. It occupies part of the basin of the South Yakaré stream in the Paraguayan Chaco, and this lake alternates between fresh and salt water conditions.

Tifunque (Ramsar nº. 730)

Located in Presidente Hayes, at coordinates 24°15'S and 59°30'W, it is a National Park with a surface area of 280,000 ha, which includes an alluvial plain along the Pilcomayo River, flooded most of the year and characterized by patches of forest, extensive grouped lakes and palm tree savannahs.

Estero Milagro (Ramsar nº. 731)

Located in San Pedro at 23°34'S and 57°22'W, it is a National Park with a surface area of 25,000 ha. The area is characterized by natural pastures, low forests, savannahs and gallery forests, swamps, small marshes and a great diversity of plant species. The site provides an important aquatic habitat for migratory birds and other animals associated with aquatic environments, as well as a habitat for the survival of several rare species and threatened plant species.

Ypoá Lake (Ramsar nº. 728)

Located in Paraguari, Ñeembucú, Central in the coordinates 26°30'S and 57°33'W, it is a National Park with 100,000 ha of surface. It is an area of extensive, shallow, grouped lakes (esterales) with mats of floating vegetation, some of which support small trees and fauna. The marshes are interspersed with wooded islands, savannas, rocky areas and streams. This site provides excellent habitat for wildlife and is one of the most important aquatic environments in Paraguay, important for several endangered species, migratory birds and five threatened plant species.

Although Paraguay has the six Wetlands of International Importance mentioned above, no Ramsar areas have been identified in the project's areas of influence.

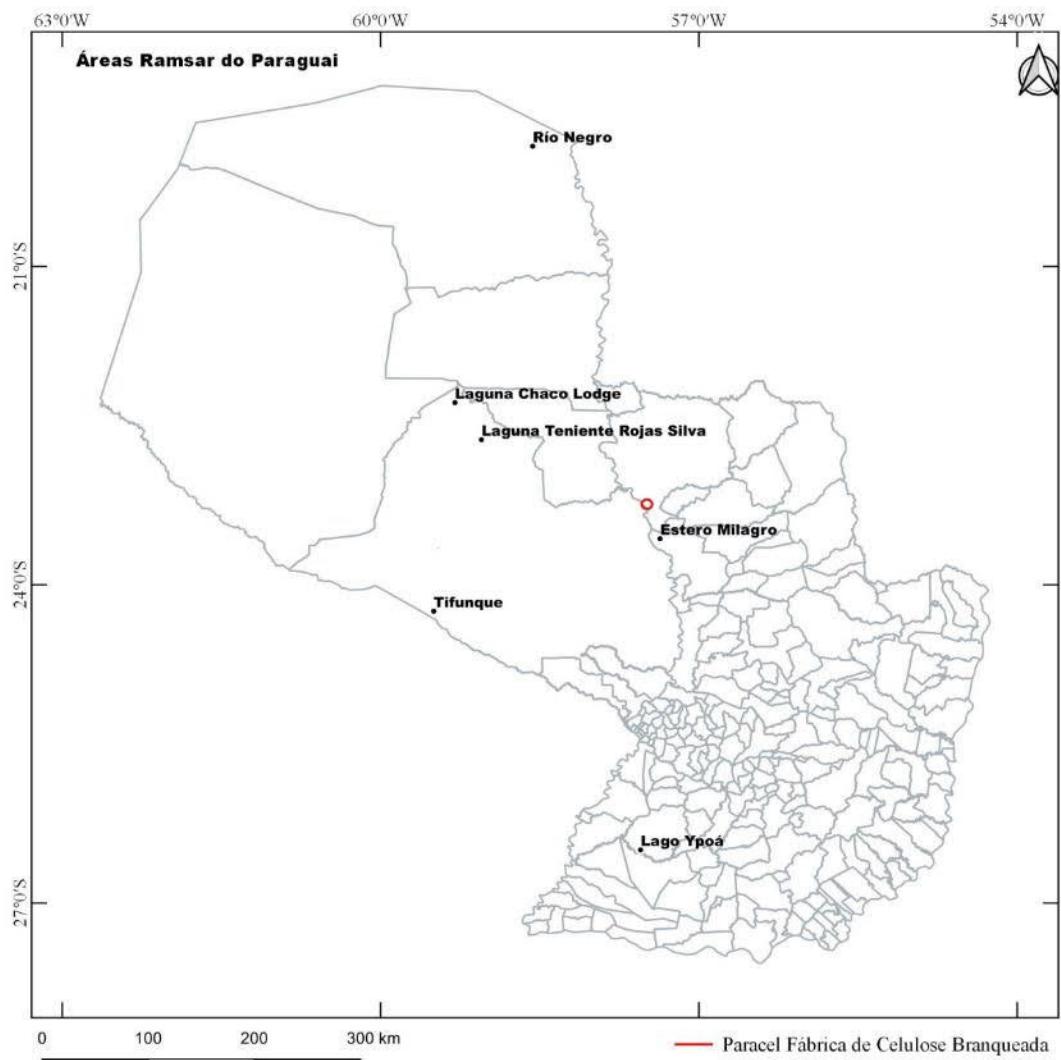

Figure 1 – Map of Ramsar areas in Paraguay. Source: Ramsar Sites Information Service (Available at: <https://rsis.ramsar.org/>).

Priority Conservation Areas

According to MADES/DGPCB (2019), information from the studies: Priority Areas for Conservation in the Eastern Region of Paraguay by the Centro de Datos para la Conservación - CDC (1990) and the Project "Priority Areas for Conservation in Five Ecoregions of South America", Project GEF/1010-00-14, was used to define priority conservation sites.

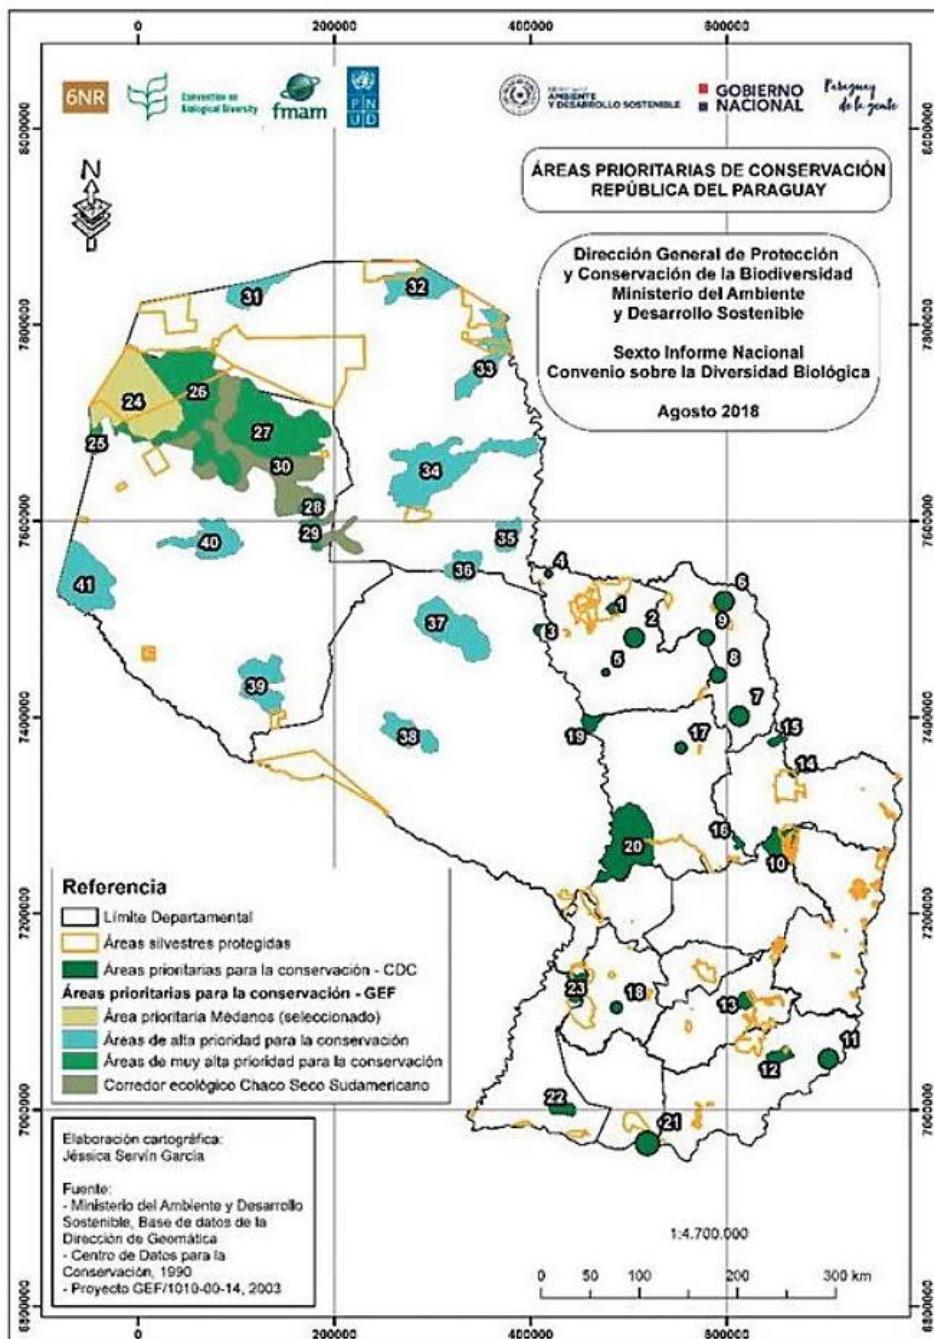

Figure 2 – Map of Priority Conservation Areas (2018). Source: MADES/DGPCB (2019).

Many of the priority areas for conservation identified in the above-mentioned studies overlap with existing protected wildlife areas - ASPs, however, in the eastern region 23 priority areas were identified that had the following characteristics: they were threatened, represented perhaps the last remaining characteristic in a virgin state of the representative ecosystems of each ecoregion, and needed more detailed scientific research. Of these 23 areas, the first five in order of priority are Mbaracayú, Bosque Arary, Cerro Guazú, Serranía San Luis and Serranía San Rafael.

In the western region, 18 priority areas were identified, which were subdivided into high and very high priority areas for conservation and two areas corresponding to the Médanos and the Chaco ecological corridor of South America. This classification took into account ecological and landscape criteria, combined with anthropogenic pressure factors and existing protected areas, and was carried out by means of a GAP analysis, which according to the CBD (Convention on Biological Diversity) is an evaluation of the degree to which a system of protected areas meets the protection objectives established by a nation or region to represent its biological diversity. High priority conservation areas have high diversity, endemism and globally important energy resources distributed over a large part of the proposed territory, as well as a high representation of highly threatened taxons and species.

The high conservation priority areas are important because of the concentration of threatened species according to IUCN, biological diversity, scenic beauty and the presence of migratory birds on Appendices I and II of the Convention on Migratory Species.

Protected Areas within the plantation farms

Regarding PS6 area prohibitions such as national park boundaries, confirmed via secondary sources are the following:

- There are three IUCN Category II national parks (Parques Nacionales – PN) north of the plantations:
 - PN Serania San Luis is approximately 15 km west of the Soledad plantation;
 - PN Paso Bravo borders three Paracel owned plantations: Soledad, Zanja Moroti, and Hermosa;
 - PN Bella Vista borders the Zapallo plantation;
- There are no Ramsar sites within the Project nor surrounding areas. The closest Ramsar Site is the National Park Estero Milagro, downstream of the Project and south of the city of Concepción;
- There is one Biosphere Reserve, Cerrado del Rio Apa, near the Project, established in 2001 by Executive Decree No. 14,431. The reserve borders much of Project plantations and its boundaries overlap portions of the northeastern most plantation Zapallo. The core areas of the reserve are within the Paso Bravo and the Serrania San Luis National Parks. The National System of Protected Natural Areas (SINASIP) considers the core areas of biosphere reserves as officially protected areas, however areas outside of core areas are not officially part of SINASIP. The core area of Cerrado del Rio Apa includes 267,836 ha while the other 174,224 ha has not been declared an official protected area by SINASIP, and it is within Zapallo and north Santa Teresa plantation areas;
- There are two Important Bird Areas (IBAs)³² near Paracel plantations:
 - Arroyo Tagatiya which sits greater than 15 km west of the Soledad plantation; and
 - Cerrados de Concepcion which overlaps with both the UNESCO Biosphere Reserve and the PN Paso Bravo, and which borders three Paracel owned plantations: Soledad, Zanja Moroti, and Hermosa.

Therefore it is recommended that in Soledad, Zanja Moroti, Hermosa, Zapallo and Santa Teresa plantation areas, a differentiate Land Use should be performed to increase the conservation areas.

6.1.2 Methodology

6.1.2.1 General

The proposed methodological intervention focuses on the Rapid Ecological Assessment (REA). The REA methodology integrates multiple levels of biological and ecological information for effective decision-making on conservation, planning, and management (Sayre et al. 2000). It allows to collect, interpret and interrelate, at the office and field level, all the scientific - technical information possible to obtain on the study area in a limited time (Sobrevila & Bath 1992). The information is collected through a process known as stratified sampling, which allows the analysis of data at a gross level or of little detail, this guiding the collection and analysis of data at a level of greater detail.

For this proposal, as considered relevant, level 2 and level 4 data (from a REA) were applied. At the Level 2: High resolution images, to produce a Vegetation Cover Map. This vegetation cover map made it possible to identify not only the existing ecosystems within the ecoregion(s) but also the identification of natural communities. These landscape units were referenced and quantified in terms of area. And, Level 4: Field work, to produce information on species diversity and habitat quality. As planned, species diversity was measured in terms of specific richness and abundance.

In addition, in order to offer a complete baseline, existing maps and cartographies were used, including a map of ecoregions, changes to land use and deforestation events, a map of priority areas, water resources, edaphic and climatic resources, to offer complete information for decision making.

The basic steps, according to the methodology of a REA include: Definition of objectives, Data acquisition, Data analysis, Analysis verification, Product generation, Recommendations and applications. This analysis allows generating the evidence and demonstrating the routes for obtaining the information so that the same methodology, with or without modifications, could be repeated in the future, thus giving the best possible use to the Baseline Study.

In order to understand the number of species collected and the sampling effort, techniques for accumulation curves and biodiversity indices (Shannon-Weaver and Simpson) were used which are described in each of the taxa.

The biodiversity baseline study was divided in two field campaigns, one during the rainy season carried out from 12th to 22nd December 2020, and from 25th March and 5th April 2021, and another in the dry season, carried out 9 to 20th May 2021 developed early in the dry season. The dates of March 25 as part of the rainy season, such as the beginning of May for the dry season, were carried out according to the requirements of the contractor to complete the biodiversity base sampling. In total, effective field tasks of 10.5 days were carried out in December with four sampling areas (AM), 9.5 days in March with three AMs and 9.5 days of sampling in May in seven AMs areas with a duplicated team working synchronously. This gives a total of 29.5 days of effective field work with an investment of 4.21 days per AM in total for both seasons, or 2.1 days per AM per season.

Five workshops for the preparation and selection of sampling areas were carried out using information based on GIS as well as lists of cited species and of possible occurrence at the sites. Representative areas were selected based on the criteria of representativeness and convenience. An extensive bibliographical search was carried out for all taxonomic groups, focusing on those occurring within the departments of Concepción and western Amambay, so as to be prepared for what we could expect to find at the sites, based on possible species records from scientific articles, scientific collections and records from other surveys carried out in neighboring properties as well as in conservation areas.

Meetings were held with professionals from PARACEL and at their invitation with experts from international financial entities, after these meetings the decision was made to expand the first field campaign from December 2020, and to carry out a second sample at the end of the rainy season (March and April), in addition to designing a sampling for chiroptera using modern bioacoustic techniques and environmental DNA sampling in some 190 localities that had water available. These two components, chiropterofauna and Environmental DNA, will be the focus of another report. However, bat sampling and monitoring carried out asynchronously with the team (in April) is integrated in this baseline. A preliminary report on eDNA in the samples is integrated in this report. Additionally, data on other biodiversity species, such as invertebrates and fungi, add information to this baseline report.

The studies were carried out mainly on seven properties (estancias), which are referred to as sampling areas. These were identified as representative areas of the ecoregions and include all the environmental units previously identified as relevant. The sampling areas are Soledad, Gavilán, Trementina, Hermosa, Zapallo, Santa Teresa and San Liberato. Sampling stations, sampling points and transects in all taxonomic groups were associated to the identified plant formations while ichthyofauna was the only group in which complementary stations took place.

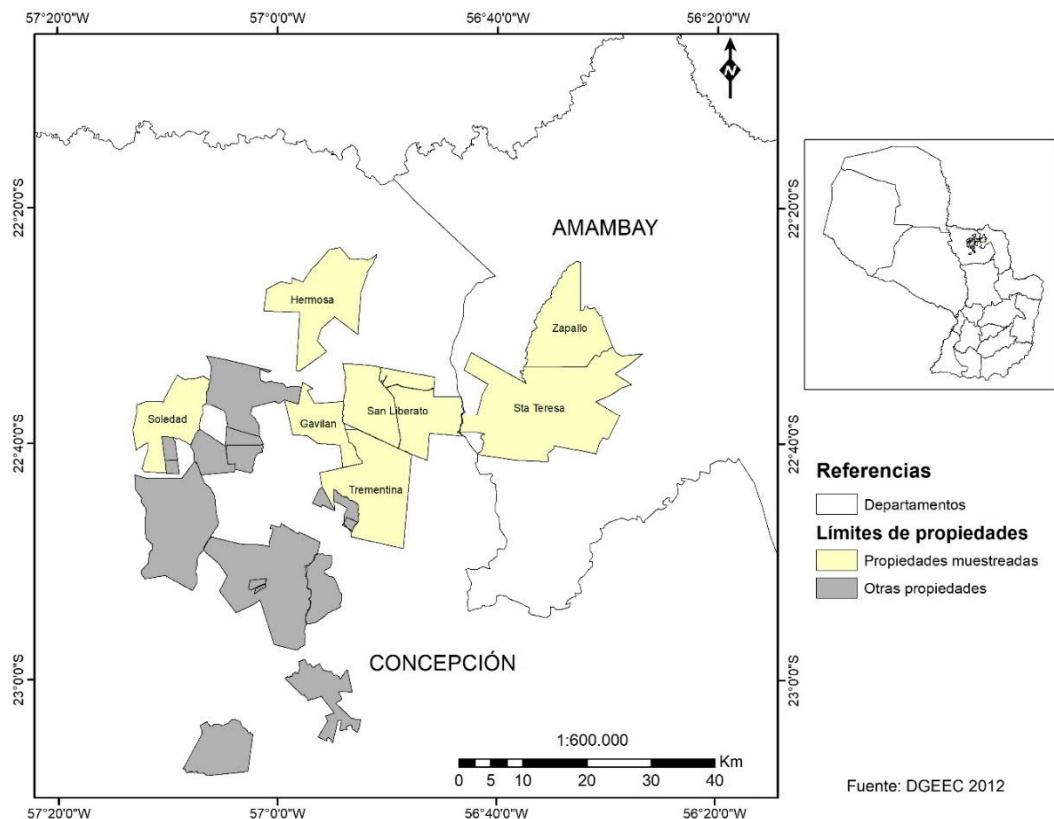

Figure 3 – Map showing sampling areas.

In terms of fieldwork, methodologies were carried out according to the type of taxa being studied, applying direct and indirect methods, as well as employing the use of drones to confirm the GIS analysis where necessary. At all times, the sampling sites were guided by the natural communities and a botanical survey (Table 2–1, Figure 2–2). The various specialists worked together, comprehensively, documenting all records thoroughly. Movements between sampling sites were made to secure any relevant record that might enrich the biodiversity baseline (“casual records/sightings”, in the REA methodology); furthermore, night patrols were also carried out in order to increase the probability of finding the more cryptic species. The local inhabitants and ranch personnel were contacted *ad libitum* to inquire about the presence of observed species. The entire team worked with any available digital platforms (@Avenza Maps) taking advantage of these for photographs and geolocations.

To determine the degree of threat according to the International Union for Conservation of Nature (IUCN), the website of the Red List was consulted (<https://www.iucnredlist.org/>); meanwhile, the degree of threat at a national level was determined based on the official resolutions of the Ministry of the Environment and Sustainable Development (MADES): Res. MADES N°470/19 for flora, Res. MADES N°433/19 for amphibians, Res. N°254/19 and SEAM N° 632/17 for birds and mammals, and MADES Res. N°206 for reptiles. To determine whether any species were included in a CITES Appendix, the website of the Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES) was consulted (<https://cites.org/esp/disc/species.php>). For the identification of uses, various types of bibliographic sources were consulted, and complemented further based on the

knowledge of experts and local inhabitants, as well as observations during fieldwork (in the case of melliferous species and consumption by fauna).

6.1.2.2 Specific

Plants and Vascular Flora

For the characterization of plants and vascular flora, a preliminary classification of the plant formations and communities was carried out and the sampling sites were established during deskwork. Data was collected from 34 Sampling Stations (EM) of 50m x 4m for forest formations and 50m x 2m for *campos cerrados*, *campos sucios*, and savannas. Similarly, 25 circular Observation Points (PO) with a 10m radius were set up and complemented with casual sightings (records of relevant/representative species outside EMs and POs). All species sighted in EMs, POs or OCs were identified and recorded in field forms, following Sayre et al. (2002). All fertile specimens were collected (whole herbs and cuttings from subshrubs, shrubs and trees) and deposited in the Herbarium of FACEN / National University of Asunción. Non-fertile specimens were collected in the case of missing determinations. Plant environments and communities were identified and described, specifically recording data on dominant and rare species. The plant formations were characterized following the criteria proposed by Mereles (2007), Prado (2000) and Spichiger et al. (1995). The list provided in the results section contains updated scientific nomenclature, based on internationally accepted databases and specialized publications.

Table 2 – Summary of Sampling Sites (original names in Spanish remains for comparisons).

Legend: *EM: estação de amostragem, PO: ponto de observação. Mata Ciária (Mereles & Duré Rodas (2015)*

Nº	Site	Code	Formation/Community	Geographical Coordinates	Altitude (masl)

Methodology of work in field campaign

Figure 4 – A: Coordination among different taxonomic teams, B: Pre-processing of botanical sampling, C: Exchange and coordination with PARACEL technicians; D y E: Information gathering in sampling stations (EM)

Ichthyofauna

For the ichthyological survey, active methods were used with cast nets, hand nets and trawling nets as well as manual fish. At night, cast net and manual fishing techniques were used, in addition to crab and umbrella-type traps, each specimen was photographed

and released again employing the catch and release method. At each monitoring point, various combinations of fishing methods were carried out, following a strict procedure: from the marked point three trawls/drags to the left and to the right and ten attempts with the hand net each side, manual fishing (if the site allows) for two hours and several attempts with the cast net. Two umbrella-type traps with eight openings and one of the crab-type traps were also placed on each side, totaling six traps per sampling site. These traps remained in place for approximately 30 hours. For the lentic environments, cast net and manual fishing techniques were employed. Furthermore, the types of aquatic environments were recorded, including dates and coordinates. Eighteen sampling sites were surveyed during 20 days of fieldwork. Ichthyofauna was the only group to include additional sampling sites.

Table 3 – Ichthyological sampling points within the study area

Sampling Sites	Geographical Coordinates	Habitat Classification	Aquatic Environment Type
Point 1 (Ea. Gavilán)	22°40'9.34"S; 56°54'0.39"W	Lotic	Stream
Point 2 (Ea. Gavilán)	22°37'34.79"S; 56°56'57.78"W	Lentic	Reservoir

Herpetofauna

Active searches were carried out by day and by night over 20 days along sampling transects ranging 200-300-500 meters for each of the associated plant formations identified. A total of 12 transects with four repetitions in each (except in two of them in which three repetitions, and in three of them two repetitions); thus reaching 40 samples in BA (18), CC (4), SI (8), BR (8) and CD (2). The searches involved observational walks during times of greatest foraging activity; that is, during the morning until noon (10:00 – 13:00) and in the afternoon just before sunset (16:00 – 19:00). Bearing in mind that amphibian and reptile activity times vary substantially at a specific level, potential shelters for frogs, lizards and snakes -such as under logs, rocks and burrows of other vertebrates- were also inspected during in each walk (Heyer et al. 1994, McDiarmid et al. 2012). A total of 94 lists over 54 transects. Random searches were also carried out whenever possible. Amphibian breeding sites were sampled, which were identified during the day (permanent or temporary bodies of water) and by night employing a random search based on auditory scans. Based on the amphibian behavior of having species-specific advertisement calls, where males call females to breeding sites (Duellman & Trueb 1994, Emerson & Boyd 1999), vocalization recordings were employed to identify and record species, making use of the available sound guides (De

la Riva et al. 2000, Haddad et al. 2005, <https://amphibiaweb.org/lists/sound.shtml>) as well as the herpetologist's own database of sound recordings. To confirm the identifications, the vocalizing species were located whenever possible with the aid of a headlamp. Individuals were manipulated either by hand or occasionally with a snake hook or forceps. The following sources were used to consult amphibian taxonomy: Brusquetti & Lavilla (2006), Smith et al. (2012), Weiler et al. (2013), Lavilla & Brusquetti (2018), Magalhaes et al. (2020). In the case of reptile taxonomy, Cacciali et al. (2016), Cacciali & Kohler (2018) were used.

With the data obtained, the total richness was calculated in the entire study area and also in each sampled plant formation. Accumulation curves were generated in the EstimateS program (Colwell, 2013) of species and Chao1 and Jack 1 estimators used to determine how many more species could possibly be present. To compare the diversity between areas, the Simpson and Shannon indices were calculated with the Past v.4 program (<https://www.nhm.uio.no/english/research/infrastructure/past/>).

The herpetology sampling areas included several sites, the sites correspond to natural communities. Natural communities were identified in order to assess the richness and abundance of reptiles and amphibians. In all the sampling areas, Riparian Forests (BR) were evaluated, in three of them Degraded High Forests (BA), while Floodable Savanna (SI), High Savanna (SA) and Aquatic Vegetation (VA), in addition to the Cerrado phytofisionomies, such as Campo Cerrado (CC) and Cerradón (CD).

Ornithofauna

Bird observations were made at the sampling sites in the six natural communities visited (BR, BA, SI, VA, CC, CD) by recording the number of individuals of each species by means of 72 transects (four per community) found along 150-meter transects within 15-minute intervals. These observations were carried out during the first three hours after dawn, since this is considered the time of day with most bird activity (Blake 1992 and Ralph et al. 1996). Further observations were made during the afternoon (15:00 to 17:30) prior to a decrease in activity of the diurnal birds to further enrich the inventory and increase the sampling effort through these repetitions, completing the survey by means of 192 lists generated by transect, and 43 lists outside the transects by occasional records. Certain species were also recorded through interviews with local inhabitants and with specialists who either visit often or know the area well; although these interviews do not take into consideration the number of individuals for each species, they do contribute to the total species richness for the area. With regards to the materials used for the observations, we can mention a 10 x 42 binocular and the Identification Guide to the Birds of Paraguay (Narosky & Yzurieta 2006). Furthermore, sound databases were used for playback, including Bird Sounds from Southern South America and Xeno-canto (2005), with the purpose of maximizing the possibility of obtaining more records (such as those endemics to the Cerrado or of probable occurrence), as well as for the validation of the vocalizations heard in the field. For the post-processing of the data back in the office, the taxonomic classification was based on Remsen et al. (2020), meanwhile, bird nests were identified with the aid of a guide to the nests of birds in Paraguay (*Guía de Nidos de Aves del Paraguay*; De la Peña 2010), the state of occurrence was based on Guyra Paraguay (2004), and Silva (1997) was used to determine the species endemic to the Cerrado. In order to support the characterization of the records, the CITES database (UNEP-WCMC 2020) was consulted to determine which species are included. Finally, the IUCN Red List (IUCN 2021) was used to determine the threat categories at an international level, and the MADES Resolution No. 254/19 "Updated list of protected wildlife species: Class Aves" was used to determine the threat categories at the national level.

The ornithological sampling areas included several sites, the sites correspond to natural communities. Natural communities were identified in order to assess the richness and abundance of birds. In all the sampling areas, Riparian Forests (BR) were evaluated, in three of them Degraded High Forests (BA), while Floodable Savanna (SI), High

Savanna (SA) and Aquatic Vegetation (VA), in addition to the Cerrado phytofisionomies, such as Campo Cerrado (CC) and Cerradón (CD).

Sampling avifauna in different natural communities in study area

Figure 6 – Photo: (Rebeca Irala & Nicolás Cantero)

Mammalian Fauna

Both direct and indirect survey methods were employed. For direct data collection, intensive searches were carried out in which all observed mammals and their traces were recorded, including footprints, feces and other signs of presence. The searches were carried out both on foot and with vehicles through the various natural communities identified, both by day and by night based on the most typical activity patterns of mammals. Twenty-seven sampling stations for nine camera traps were set up for different periods of times with rotating locations according to the explorations of the nine sites with a total of 66 nights/traps in the different plant communities.

This was done to increase the probability of detecting cryptic or rare species. Data on chiropterans were also collected through the use of three mist nets located near the farmhouses to facilitate the working with them while checking the nets; these nets were

opened and checked according to logistic opportunities totaling six nights of sampling. To obtain systematized data, 46 linear transects of 200m x 2m were made in six of the identified natural communities (BR, BA, SA, SI, CC and CD). According to the temporal and spatial possibilities, repetitions were carried out on different days and in different places for each of the formations. Additionally, indirect data were collected from local workers and residents, consulting them at first by the localnames and behavior of mammals for later confirm the identification with printed photographs.

The statistical analyzes were carried out taking into account only the data obtained in the linear transects and the camera traps. These analyzes included the construction of a species accumulation curve for all samplings, and the calculation of chao1 and jackknife1 richness estimators for each plant communitiy that had more than 10 sample units (BR, BA, SI and SA) (Thompson and Thompson 2010); Likewise, the estimation of the Shannon-weaver and Simpson diversity indices (Magurran 2004) and the construction of range-abundance graphs (Feisinger 2004) for these plant formations were included. All analyzes were performed with the Estimates software (Colwell 2013) and with the R software (R Core Team 2020) using the BiodiversityR package (Kindt and Coe 2005).

Specialized guides were used for the identification of mammals, their footprints and other signals (De Ángelo 2017, Canevari 2007, Villalba & Yanosky 2000). Furthermore, the identification of species according to their category of threat at a national and international level was carried out following the Red Book of Mammals of Paraguay (APM & SEAM 2017, Resolution SEAM N°632/17 “Updated list of protected wildlife species: Class Mammalia”) and the IUCN Red List (IUCN 2021), respectively. The general taxonomy follows Wilson & Reeder (2005) with updates considered by Sancha et al. (2017), but accepting the change proposed by Segura et al. (2013) for the species *Herpailurus yagouaroundi*.

For a better understanding of the field distribution, sampling stations and observation points (EM, PO), ichthyological points and stations (E), as well as location of camera traps (CT) are depicted in Figure below.

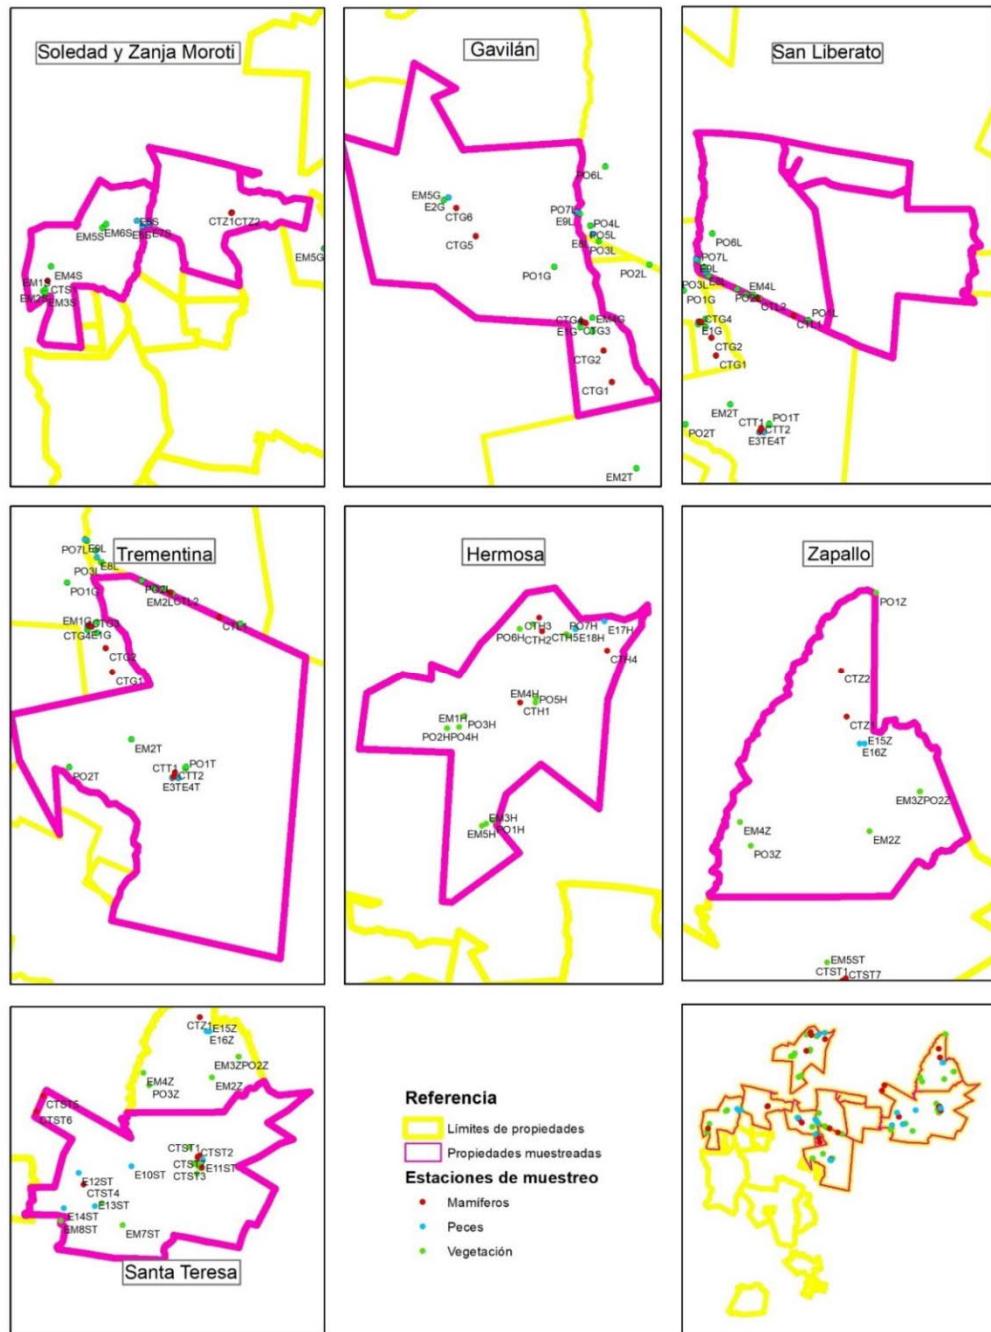

Figure 7 – Location of sampling stations, observation points and camera traps.

6.1.2.3 Sampling areas and ecoregions

The *Cerrado* in Paraguay occupies relatively small discontinuous areas forming a mosaic pattern. As a formation, the *Cerrado* is classified under various ecoregions (Fig. 3. and Fig. 4); however, it became evident that the study area is more of a convergence between the *Cerrado* and the contiguous Humid Chaco and Upper Paraná Atlantic Forest ecoregions, more in line with what was proposed by Dinerstein et al. (2017). With this in mind, the study area presents a *Cerrado* - Atlantic Forest transitional area to the south and east, meanwhile to the west and south, the study area presents a *Cerrado* - Humid Chaco transition. This confluence results in unique characteristics in terms of the assemblages of fauna and flora present.

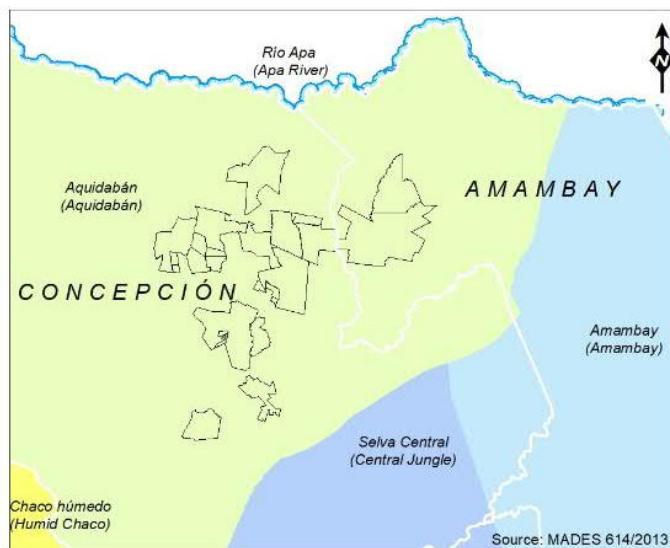

Figure 8 – Location of properties based on MADES Ecoregions (Resolution 614/2013)

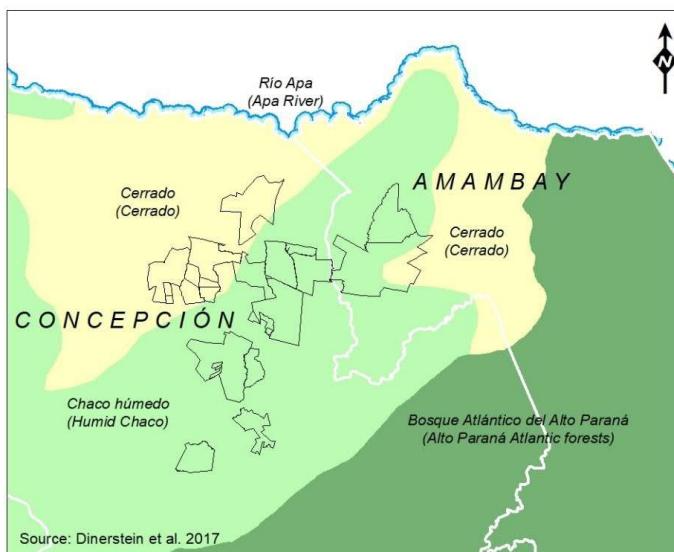

Figure 9 – Location of properties based on Ecoregions by Dinerstein (2017)

In both biogeographical and ecoregional terms, the area is located within the *Cerrado* in a broad sense, yet it is common to find environments that correspond to the Humid Chaco in some properties, while others present elements and environments that correspond to the tall forests of the Atlantic Forest of Alto Paraná.

Within the study areas, tall forests and forest patches develop on the higher grounds with different soil characteristics; this vegetation presents a floristic structure and elements of tall forests. The presence of these forests is easily identifiable in historic images that allow us to visualize the study area prior to the changes made in the productive landscape.

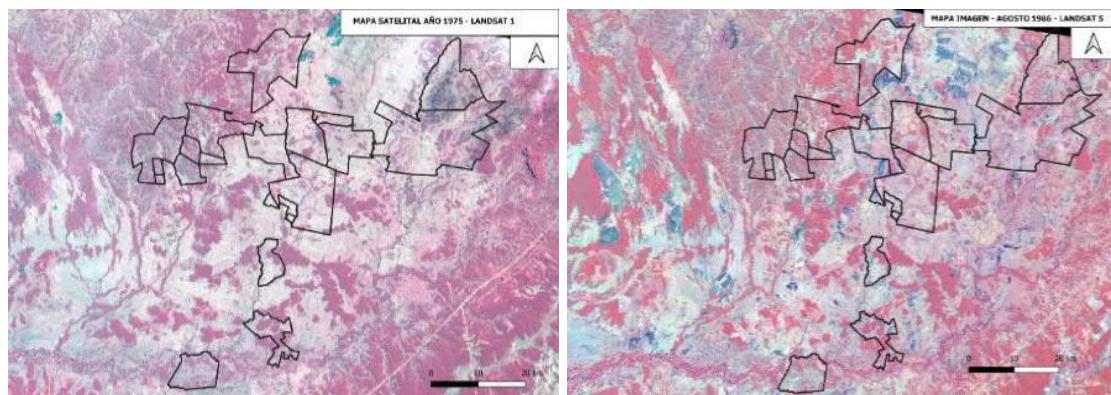

Figure 10 – PARACEL properties on satellite images (Landsat 1) from 1975 and 1986.
(Ref.: Vegetation is seen in red tones, darker and more solid red areas represent forests, and lighter and less solid red areas represent sparse vegetation and/or of less height, and lighter tones represent natural grasslands)

6.1.3 Terrestrial Flora Seasonal Results

The floristic richness for the study area is comprised of 667 species of vascular plants, belonging to 346 genera and 94 botanical families. Also the information about common names and conservation status (national, regional, IUCN) is found in the same spreadsheet.

Table 6 – Flora species richness

Taxonomic Group	Number of Species	Number of Families
Pteridophytes	22	09
Monocots	133	15
Dicots	512	70

During fieldwork, the opportunity was taken to record species other than the taxa focused on in the diversity baseline study, including fungi. The collection of images and latter identification resulted in the mention of a total of six species of fungi, in the field campaign of December, and 21 species of fungi with photographic records, five of them with gastronomic importance and nine of medicinal importance, collected during the March-April field campaign.

6.1.3.1 Primary Data – Rainy Season

The following **eight plant formations or plant communities** were identified, three of which correspond to forest phytophysionomies and five to savannas: Degraded Tall Forest, Riparian Forest, *Cerradón*, *Campo Cerrado*, Dirty Fields (*Campo Sucio*), High Savanna and Floodable and Flooded Savanna, each with varying degrees of richness.

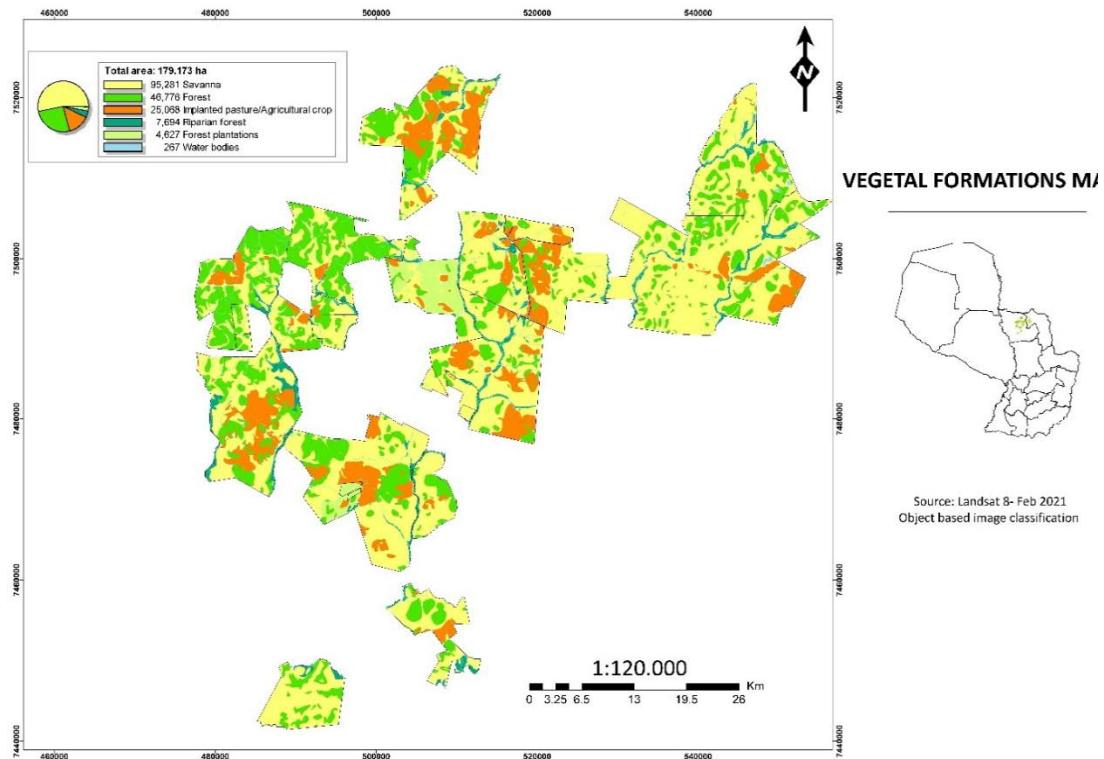

Figure 11 – Plant formations in the different properties. Source: CSI, 2021.

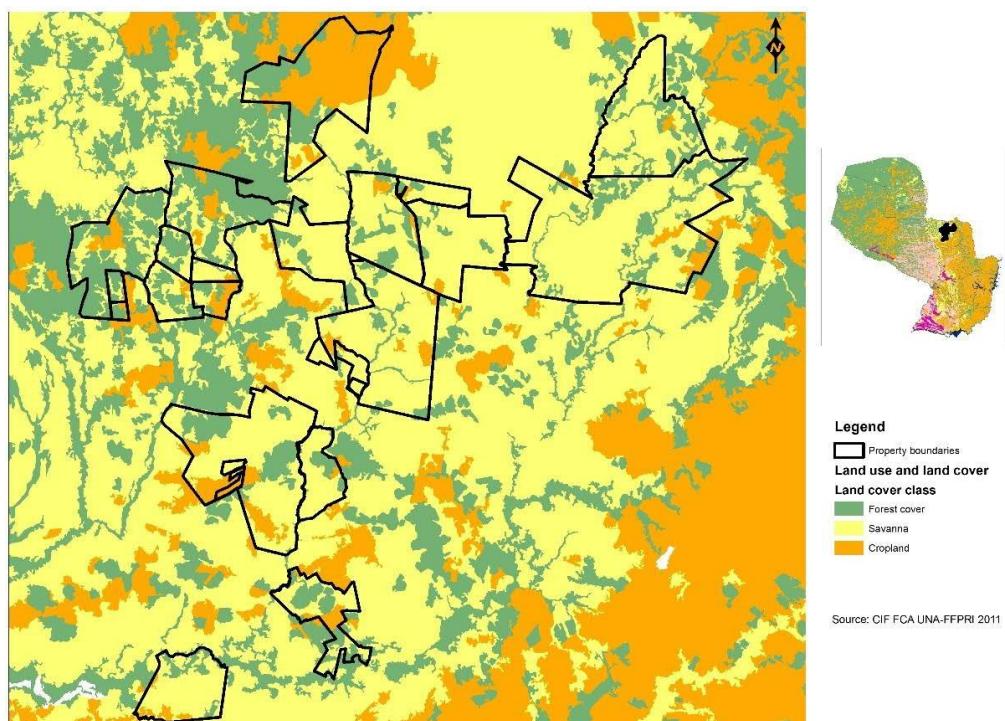

Figure 12 – Imagen Map Cover and Use for all PARACEL properties, after CIF FFPRI FCA/UNA (2011).

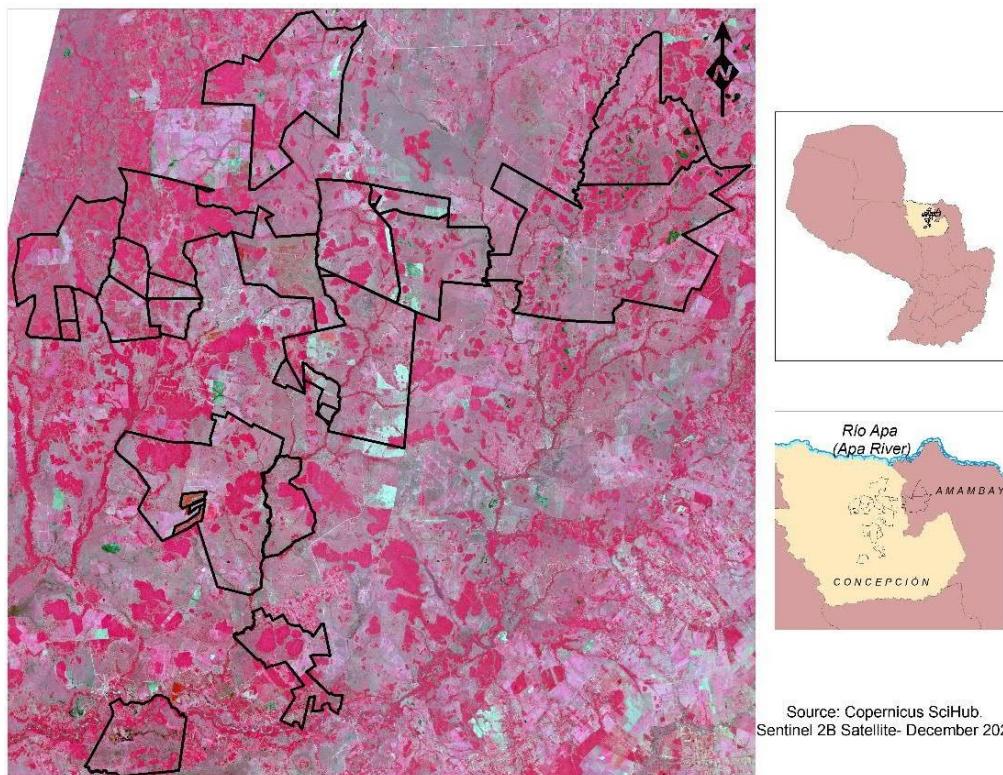

Figure 13 – Imagen map for 2020 Cover (Copernicus SciHub 2020)

As a result of the baseline study, the presence of the different plant communities or formations has been mapped, and the FFPRI-CIF / FCA (2012) map, with it it is possible to compare the changes that have occurred. Also, the 2020 land cover map provides evidence of predominance of sabanoid formations. The complete description of Vegetation is presented below.

The floristic diversity of all the identified plant formations was determined based on direct observations, collections and processing (in the field and in the office) of more than 3,500 specimens of vascular plants (both fertile and sterile).

The flora richness of the studied área is represented by 667 species; 346 genera and 95 families. Eight Families, 15 genera and 21 species are Pteridophyta; 133 sspecies, 57 Genera and 15 Families are Monocotyledonae and 513 species, 274 Genera and 72 Families are Dicotyledonae. The 667 species represent the 10.3 % of the total number of plants estimated for Paraguay (6,500; Mereles 2007). Based on Mereles (2007) estimates for vascular plants, in this study the 6.4% of them have been recorded. Of the 95 Families recorded, 28 of them present a greater diversity.

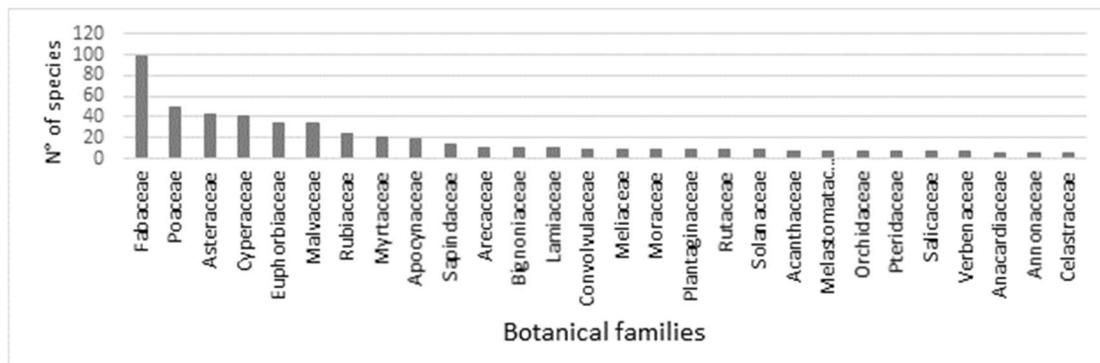

Figure 14 – Families with highest biodiversity identified within PARACEL properties. Source: CSI, 2021.

All plant formations, the flora and the fieldwork process were recorded by approximately 10,000 digital photographs.

The endemic flora (Peña-Chocarro & De Egea 2018) is represented by three species: *Bidens chodatii* (Asteraceae), *Ipomoea* aff. *aemilii* (Convolvulaceae) and *Arachis hassleri* (Fabaceae). Of the total species recorded, 18 are included in the National List (as Endangered or Threatened) and seven are included in the IUCN List. Seven more are included in Appendix II and one in Appendix I of CITES.

Eight types of use were identified (food, fuel, animal feed, industrial, construction material, medicinal, melliferous and ornamental) for 162 species of the flora surveyed within the study area.

6.1.3.1.1 Description of vegetation physiognomies

Degraded Tall Forest (BA)

Is characterized by presenting an average height of 12 m (which can reach up to 18 m) with three strata; the middle and lower strata being the ones with the highest density and diversity of species. In this formation the understory is not very dense, with few epiphytes and lianas. The natural regeneration of some tree species was noted. There is evidence of selective harvesting of its most valuable species and the invasion of exotics in the clearings. The soil is sandy in texture, red in color and covered by a thick layer of leaf litter.

It reaches a height of 16-18 m. **Upper stratum** species *Talisia esculenta* (karaja bola), *Holocalyx balansae* (yvyra pepe), *Guibourtia hymenaeifolia* (kuruñai), *Albizia niopoides* (yvyra ju), *Guarea guidonia* (cedro blanco), *Cordia americana* (guajayvi), *Balfourodendron riedelianum* (guatambu), *Aspidosperma pyrifolium* (palo rosa), *Cupania vernalis* (jagua rata'y pytã), the **Middle Stratum** species *Myrciaria cuspidata* (typucha ka'aguy), *Amburana cearensis* (trébol), *Astronium fraxinifolium* var. *glabrum* (urunde'y para morotí), *Peltophorum dubium* (yvyra pytã), *Casearia gossypiosperma* (mbavy guasu), *Aspidosperma pyrifolium* (palo rosa), *Chrysophyllum gonocarpum* (aguai), *Parapiptadenia rigida* (karupa'y rã), *Cassearia gossypiosperma* (mbavy guasu), *Helietta apiculata* (yvyra ovi), *Maclura tinctoria* ssp. *tinctoria* (tata jyva),

Cordia americana (guajayvi), *Guibourtia hymenaeifolia* (kuruñai), *Albizia niopoides* (yvyra ju), **Lower stratum** *Actinostemon concepcionis*, *Philyra brasiliensis*, *Trichilia catigua* (katigua pytā), *Neea pendulina*, *Myrciaria cuspidata* (typcha ka'aguy), *Annona emarginata* (aratiku'i), *Randia calycina* (ñuatí kurusu), *Casearia* sp.1, *Combretum leprosum*, *Attalea phalerata* (guacuri), *Randia aff. brevituba* (ñuatí kurusu), *Allophylus pauciflorus* (kokū), *Prockia crucis*, *Celtis iguanaea* (juasy'y).

The **undergrowth** is sparse, made up of herbaceous plants, lianas, natural regeneration. The species present are *Dasyphyllum* sp., *Lacistema sorghoidea*, *Tocoyena formosa*, *Piper* sp.1, *Doryopteris pentagona*, *Justicia brasiliiana*, *Geophila repens*, *Oeceoclades maculata* (orquídea burrito), Epítitas what *Microgramma vacciniifolia* (anguja ruguai), *Pleopeltis minima*, Lianas what *Hippocratea volubilis*, *Dalechampia* sp.

Figure 15 – Degraded high forest - San Liberato (L. Pérez de Molas)

In some sectors, the understory is dominated by *Actinostemon concepcion* and *Acanthoclada albicans*.

Natural regeneration of *Trichilia elegans* (katiagua'i), *Protium heptaphyllum* (yvyra ysy), *Parapiptadenia rigida* (kurupa'y ra), *Ocotea diospyrifolia* (laurel sa'yju), *Rhamnidium elaeocarpum* (taruma'i), *Myrcianthes pungens* (guaviju), *Myrocarpus frondosus* (incienso), *Olocalyx balansae* (yvyra pepe), *Amburana cearensis* (trébol), *Aspidosperma pyrifolium* (palo rosa), *Trichilia pallida* (katigua morotí), *Actinostemon concepcionis*, *Allophylus pauciflorus* (kokū).

Cordia trichotoma (peterevy) and *Celtis iguanaea* (juasy'y) are present at the edge and edge of the road. The soil is sandy, covered with litter, with depressions that form areas of accumulation of water, many small clearings invaded by Colonial Pasto.

- DEGRADED HIGH FOREST - Santa Teresa

It is a semi-deciduous forest with a height of 22-25 m, it has three layers, **Upper stratum:** *Myroxylon peruferum* (incienso colorado), *Peltophorum dubium* (yvyra

pyta), Myrtaceae (Arraijan), *Guibourtia hymenaeifolia* (kuruñai), *Anadenanthera colubrina* var. *cebil* (kurupa'y kuru), *Balfourodendron riedelianum* (guatambu), *Sideroxylon obtusifolium* (guajayvi rai), *Ceiba* sp. (samu'u), *Enterolobium timbouva* (timbo), *Myracrodroon urundeuva* (urunde'y mi), *Handroanthus impetiginosus* (lapacho rosado) **Middle stratum:** *Holocalyx balansae* (yvyra pepe), *Calycophyllum multiflorum* (palo blanco), *Maclura tinctoria* ssp. *tinctoria* (tata jyva) *Parapiptadenia rigida* (kurupa'y rã), *Guazuma ulmifolia* (kamba akã), *Casearia gossypiosperma* (mbavy guasu), *Averrhoiodium paraguaiense*, *Chrysophyllum gonocarpum* (aguai), *Pterogyne nitens* (yvyra ro), *Myrcianthes pungens* (guaviju), *Agonandra brasiliensis*, *Syagrus oleracea* (guaviroba), *Neea* sp., *Samanea tubulosa* (manduvira), *Helietta apiculata* (yvyra ovi), *Myrciaria cuspidata* (typcha ka'aguy), *Attalea phalerata* (guacuri), **Lower stratum:** se destaca la dominancia de *Gymnanthes discolor*, acompañada por *Trichilia catigua* (katigua pyta), *Trichilia pallida* (katigua moroti), *Adelia membranifolia*, *Allophylus pauciflorus* (oku), others.

The **undergrowth** is sparse with abundant lianas, mainly *Pisonia aculeata* (jagua pinda), *Semialarium paniculatum* and several species of Bignoniaceae, some epiphytes such as *Thaumatophyllum undulatum* (guembe), *Peperomia aceroana*; terrestrial herbaceous and woody plants such as *Pharus lappulaceus* (ka'i arro), *Pteris denticulata*, *Doropteris* sp., *Dioscorea* sp., *Pseudananas sagenarius* (yvira), *Randia* sp., *Trichilia elegans* (katigua'i) and *Clavija nutans* (tumby rasy poha).

Although natural regeneration is scarce, it is present, some of them are: *Holocalyx balansae* (yvyra pepe), *Chrysophyllum gonocarpum* (aguai), *Sweetia fruticosa* (taperyva guasu) and *Helietta apiculata* (yvyra ovi).

Foto: (L. Pérez de Molas)

Figure 16 – Degraded High Forest. Santa Teresa.
26.03.2021

It occupies the highest portions of the land, in discontinuous formations of variable extension, alternating with large areas of high and flooded savannas. The soil is sandy, red, covered by abundant litter. Rocky outcrops appear in some places.

The presence of large ant hills and some fauna burrows were observed. In addition, some stumps of large harvested trees and logging roads that are already in disuse.

TRANSITIONAL (ECOTONAL) FOREST BETWEEN DEGRADED HIGH FOREST AND CERRADON

It reaches a height of up to 11 m. Upper layer *Inga uraguensis* (inga guasu), *Astronium fraxinifolium* var. *Glabrum* (urunde'y para morotí), *Guarea guidonia* (white cedar), *Protium heptaphyllum* (yvyra ysy), *Casearia gossypiosperma* (mbavy guasu), *Styrax* sp., Middle stratum *Trichilia pallens* (Katigua morotí), *Trichilia pallida* (Stratum morotí) bottom: *Peltophorum dubium* (yvyra pytã), *Casearia* sp. 1, *Piper* sp. 1, *Cordiera sessilis* (Asuka revira), *Agonandra brasiliensis*.

At the edge of the forest appear *Didymopanax morototoni* (amba'y guasu), *Parapiptadenia rigida* (kurupa'y rã), *Enterolobium contortisiliquum* (timbó), *Anadenanthera colubrina* var. *cebilo* (kurupa'y kuru).

Understory: *Myrsine* sp., *Rhamnidium elaeocarpum* (taruma'i), lianas such as *Forsteronia glabrescens* (ysypo kamby), *Prockia crucis*, *Trichilia catigua* (katigua pytã), *Piper* sp. 1 Abundant natural regeneration was also observed.

In some sectors this forest reaches a height of only 5-7 m, with emergencies of up to 9 m dominated by *Attalea phalerata* (guacuri). The upper stratum species *Myracrodroon urundeuva* (urunde'y mi), *Sapium haemathospermum* (kurupika'y), *Attalea phalerata* (guacuri), *Ficus* sp. (handsome'y), in the middle stratum *Samanea tubulosa* (manduvi rã), *Attalea phalerata* (guacuri), *Machaerium acutifolium*, *Ocotea diospyrifolia* (laurel sa'yju), *Protium heptaphyllum* (yvyra ysy), *Casearia* sp. 1 Lower stratum *Helicteres lhotzkiana*, *Maclura tinctoria* ssp. *Tinctoria* (tata jyva), *Guarea guidonia* (white cedar) and *Attalea phalerata* (guacuri).

Figure 17 – Transitional (ecotonal) forest (high forest – cerradão) - Gavilan.

Foto: (L. Pérez de Molas)

The understory is almost absent, few lianas and very little natural regeneration. The soil is sandy, covered with abundant litter. The gently sloping topography.

Relays:

EM2G Coordinates: 22° 40' 20,3''S 56° 53' 44,7'' W, Altitud 155 msnm

EM3G Coordinates: 22° 40' 20,3''S 56° 53' 44,3'' W, Altitud 164 msnm

Riparian Forests (BR)

Follow water courses, and are generally contiguous with floodable savannas. They are characterized by having an average height of up to 14 m (which can reach up to 18 m) with three strata, the lowest being the one that presents highest density and diversity of species. It is important to highlight the presence of tree species belonging to the *Cerradón*. In this formation, the understory is sparse, with few epiphytes and lianas; however, the natural regeneration of tree species is visible. There is evidence of selective harvesting of its most valuable species as well as the presence of cattle. The soil is sandy and covered by abundant leaf litter. Nine surveys were carried out in this formation and 133 species were recorded.

– Riparian Forest - Trementina stream

It develops on the banks of the Arroyo Trementina, a tributary of the right bank of the Aquidabán River. (Fig. 10)

It reaches a height of 16-18 m. Upper layer: *Peltophorum dubium* (yvyra pytā), *Anadenanthera colubrina* var. *cebil* (kurupa'y kuru), *Protium heptaphyllum* (yvyra ysy), *Aspidosperma pyrifolium* (palo rosa), *Inga uraguensis* (inga pytā), *Copaifera langsdorffii* (kupa'y), *Handroanthus heptaphyllus* (tajy hu) **Middle Stratum:** *Chrysophyllum marginatum* (pykasu rembi'u), *Sorocea sprucei* (Maria molle), *Albizia niopoides* (yvyra ju), *Phyllanthus chacoensis* (jakare pito), *Enterolobium contortisiliquum* (timbo), *Garcinia brasiliensis* (pakuri), *Eugenia uniflora* (ñangapiry), *Salacia elliptica* (pakuri brasilero), *Protium heterophyllum* (yvyra ysy), *Chrysophyllum gonocarpum* (aguai), *Plathymenia reticulata* (morosyvo), *Coussarea platyphylla*, *Terminalia triflora* (guajayvi sa'yju), *Genipa americana* (ñandypa guasu), *Guibourtia hymenaeifolia* (kuruñai), *Vitex cymosa* (taruma), *Attalea phalerata* (guacuri), *Ocotea diospyrifolia* (laurel sa'yju), *Casearia gossypiosperma* (mbavy guasu), **Lower stratum:** *Casearia gossypiosperma* (mbavy guasu), *Salacia elliptica* (pakuri brasilero), *Parapiptadenia rigida* (kurupa'y rā), *Trichilia catigua* (katigua pytā), *Aspidosperma cylindrocarpon*, *Handroanthus ochraceus* (tajy sa'yju), *Garcinia brasiliensis* (pakuri), *Myrciaria cuspidata* (typcha ka'aguy), *Acanthocladus albicans*, *Cordiera sessilis* (asuka revira), *Zanthoxylum petiolare* (tembetary morotī), *Randia aff. brevituba* (ñuati kurusu), *Coccoloba* sp., *Jacaranda mimosifolia* (jakaranda), *Guarea macrophylla* ssp. *spiciflora* (cedrillo), *Annona emarginata* (aratiku'i), *Trichilia pallens* (katigua morotī), *Machaonia brasiliensis*, *Miconia* sp., *Trichilia pallida* (katigua morotī), *Randia calycina* (ñuati kurusu), *Bactris glaucescens* (karanda), *Coussarea platyphylla*, *Acanthocladus albicans*, *Celtis iguanaea* (juasy'y).

In some sectors of the forest Guadua chacoensis (takuara), forming small colonizations reaching the shore of the main course, occupying the second layer of the forest. On the edges Annona nutans (aratiku ñu) and Machaerium hirtum.

The undergrowth is sparse, with much litter, the soil is sandy, with very few lianas. Abundant natural regeneration of Myrtaceae and *Inga uraguensis* (*inga guasu*). Lianas: *Pisonia aculeata* (*jagua pinda*), *Forsteronia glabrescens* (*ysypo kamby*) and *Forsteronia pubescens*. Epifitas: *Microgramma vaccinifolia* (*anguja ruguai*), *M. persicariifolia*, *Polypodium* sp., *Rhipsalis* sp., *Campylocentrum* cfr. *neglectum* y otras herbáceas terrestres como *Adiantum latifolium* and *A. serrato-dentatum*.

In Trementina, the presence of a vegetated lagoon was recorded, with a surface area of 80 x 50 m, whose possible origin was the damming of a water channel. The following bottom-rooted species were surveyed: *Eleocharis elegans* and *Eleocharis* sp. (dominant), patches of *Pontederia azurea* (*aguape puru'a*); on the edge, but within the water *Utricularia* sp., *Lemna minuta*, *Pontederia cordata* (*camalote*) and *Nymphoides verrucosa*. *Ludwigia* sp., *Scoparia dulcis* (*typycha kuratu*), *Phyllanthus niruri* (*para'i*), *Setaria* sp., *Hymenachne amplexicaule* (*camalotillo*), *Sida cordifolia* (white mallow), *Polygonum* sp. . (*ka'a tai*), *Aeschynomene* sp., *Eupatorium* sp. 3.

In places with higher topography, there are *Sapium haematospermum* (*kurupika'y*), *Cecropia pachystachya* (*amba'y*), *Sorocea sprucei* ssp. *saxicola* (*Maria molle*), *Tocoyena formosa*, *Acrocomia aculeata* (*mbokaja*), *Vitex cymosa* (*taruma*), *Ocotea diospyrifolia* (*Laurel sa'yju*), *Bromelia balansae* (*karaguata*).

Figure 18 – Riparian Forest - Trementina stream.

Foto: (L. Pérez de Molas)

Foto: (L. Pérez de Molas)

They are also present *Actinostemon concepcionis*, *Annona neosalicifolia* (Aratiku), *Syagrus romanzoffiana* (pindo), *Psychotria* sp., *Clavija nutans* (*tumby rasy poha*), *Acanthocladus albicans*, *Randia* aff. *brevituba* (*ñuatí kurusu*).

– **Riparian florestal in Gavilan (unnamed stream)**

Forest 8-10 m. **Upper stratum:** *Ocotea disospyrifolia* (laurel sa'yju), *Trichilia pallida* (katigua morotí), *Genipa americana* (ñandypa guasu), *Samanea tubulosa* (manduvirá), *Guibourtia hymenaeifolia* (kuruñai), *Sapium haemathospermum* (kurupika'y), *Peltophorum dubium* (yvyra pytã), *Cordia americana* (guajayvi), *Inga uraguensis* (inga guasu), **Middle stratum:** *Cupania vernalis* (jagua rata'y pytã), *Salacia elliptica* (pakuri brasilero), *Chrysophyllum gonocarpum* (aguai), *Citrus aurantium* (apepu), *Trichilia pallida* (katigua morotí), *Attalea phalerata* (guacuri), *Syagrus romanzoffiana* (pindo), *Acrocomia aculeata* (mbokaja), *Terminalia triflora* (guajayvi sa'yju) **Lower stratum:** *Trichilia catigua* (katigua pytã), *Trichilia pallens* (katigua morotí), *Casearia sylvestris* (burro ka'a), *Protium heptaphyllum* (yvyra ysy), *Randia calycina* (ñuatí kurusu) and *Celtis* sp.1 (juasy'y).

In the **understory** are present *Forsteronia glabrescens* (ysypo kamby), *Bromelia balansae*(karaguata), *Tocoyena formosa*, *Lacistema* sp. and *Miconia* sp.

In Gavilán, in the *Eucalyptus camaldulensis* plantation area, approximately 10 years old, with grasses of up to 80 cm and woody growing in isolation, up to 2 m. *Pleurophora saccocarpa*, *Ludwigia* sp., *Echinodorus grandiflorus* (spoonbill), *Pontederia cordata* (camalote), *Heteropterys* sp., *Aeschynomene* sp. 1, *Paspalum* spp., *Eupatorium* spp., *Eleocharis elegans*, *Aspilia montevidensis*, *Caperonia aff. castaneifolia*, *Cuphea lysimachiooides* (ysypo pere), *Rhynchospora* spp., *Melochia simplex* among others.

In similar formation in Gavilán, on gray, humid sandy-clayey soil (fine sand), species of the Poaceae family of the genus *Paspalum* sp were also recorded. growing in large clumps, with inflorescences that reach up to 2.5 m. Other registered species were: *Psidium* sp. 3 (arasa), *Sisyrinchium* sp., *Stylosadores* sp., *Setaria* sp., *Annona nutans* (aratiku), *Rynchospora* sp., *Oedochloa procurrens*, *Imperata brasiliensis* (jahape), *Mimosa* spp. (jukeri), *Eleocharis* spp., *Hyptis* spp., *Cipura paludosa* ssp. *boliviensis*, among others.

The presence of trails was observed, surrounded by gallery forest and low forest of 8-10m. Isolated specimens of *Sapium haemathospermum* (kurupika'y), *Cecropia pachystachya* (amba'y), *Myracrodruon urudeuva* (regeneration), *Allophylus edulis* (kokú), *Schinus weinmanniifolius* (molle'i), *Acrocomia aculeguarisia* (jamaica mbokayaata) (jambokaya para i).

Figure 20 – Riparian Forest - Gavilan (unnamed stream).

Foto: (L. Pérez de Molas)

There is abundant natural regeneration of tree species.

Relays:

EM4G Coordinates: 22 ° 40 '3.1''S 56 ° 53' 44.3 '' W, Altitude 143 meters above sea level.

– Riparian forest (unnamed stream) (Potrero Ita Juru)

Forest 16-18 m. **Upper stratum:** *Enterolobium contortisiliquum* (timbo), *Syagrus romanzoffiana* (pindo), *Guazuma ulmifolia* (kamba akā), *Cordia americana* (guajayvi), *Peltophorum dubium* (yvyra pytā), *Casearia gossypiosperma* (mbavy guasu), *Genipa americana* (ñandypa guasu), *Balfourodendron riedelianum* (guatambu), *Annona neosalicifolia* (aratiku), **Middle stratum:** *Trichilia catigua* (katigua pytā), *Sebastiania* sp.1 (yvyra kamby), *Holocalyx balansae* (yvyra pepe), *Averrhoa paraguaiense*, *Chrysophyllum gonocarpum* (aguai), *Maclura tinctoria* ssp. *tinctoria* (tata jyva), *Sebastiania* sp. 2 (yvyra kamby), *Samanea tubulosa* (manduvirā), *Parapiptadenia rigida* (kurupa'y rā), *Cupania vernalis* (jagua rata'y pytā), *Genipa americana* (ñandypa guasu), *Ocotea diospyrifolia* (laurel sa'yju) **Lower stratum:** *Picramnia sellowii*, *Casearia gossypiosperma* (mbavy guasu), *Myrcianthes pungens* (guaviju), *Eugenia moraviana*, *Cupania vernalis* (jaguarata'y pytā), *Terminalia triflora* (guajayvi sa'yju), *Trichilia elegans*(katigua'i), *Randia calycina* (ñuatí kurusu), *Guarea macrophylla* ssp. *spiciflora* (cedrillo), *Tabernaemontana catharinensis* (sapiranguy), *Casearia sylvestris* (burro ka'a), *Sebastiania* sp.1, *Terminalia triflora* (guajayvi sa'yju), *Parapiptadenia rigida* (kuruap'y rā), *Sorocea sprucei* (María molle) and *Inga uraguensis* (inga guasu).

The **understory** has isolated patches of *Pseudananas sagenarius* (yvira), and *Merostachys clausenii*(takuapi), in addition to *Trichilia elegans* (katigua'i), *Guarea macrophylla* ssp. *spiciflora* (cedrillo) and *Psychotria leiocarpa*. Few lianas were observed, only *Forsteronia glabrescens* (ysypo kamby), the epiphytes present were *Thaumatophyllum undulatum* (guembe), *Pleopeltis minima* and *Microgramma vacciniifolia* (anguja ruguai), terrestrial herbaceous like *Geophila repens*, *Pharus lappulaceus*, *Pteris denticulata*, *Adiantopsis radiata* (helecho sombrilla), *Asplenium clausenii*, Cfr. *Hippeastrum* sp. (lirio), *Acalypha* sp.1, and *Desmodium* sp.1.

The formation of this category observed in Soledad, presented as dominant the species of the Poaceae family, with heights of 0.9-1 m and inflorescences of up to 2.5 m. The soil is dark, blackish, humid and in higher parts with wide and deep cracks and traces of burning.

The following were recorded: *Paspalum sp.*, *Lobelia aff. nummularioides*, *Ludwigia hassleriana*, *L. nervosa*, *Rhynchospora spp.*, *Cyperus spp.*, *Lippia sp.*, *Fimbrystylis sp.*, *Melochia parvifolia*, *Mikania sp.*, *Acalypha sp. 2*, *Heteropteris sp.*, cfr. *Hymenachne sp.*

In areas with higher topography, the following were recorded: *Stillingia aff. salpingadenia*, *Desmodium sp. 2*, *Oxypetalum sp.*, among other species.

Figure 21 – Riparian forest - Soledad.

Foto: (L. Pérez de Molas)

Figure 22 – Floodplain Savannah in Soledad

Foto: (L. Pérez de Molas)

Natural regeneration is abundant and diverse. They are present *Averrhoa paraguaiense*, *Guibourtia hymenaeifolia* (kuruñai), *Salacia elliptica* (pakuri brasilero), *Chrysophyllum gonocarpum* (aguai), *Trichilia clausenii* (catigua guasu), *Monteverdia ilicifolia* (kangorosa), *Trichilia catigua* (katigua pytā), *Balfourodendron riedelianum* (guatambu), *Rhamnidium elaeocarpum* (taruma'i), *Cupania vernalis* (jagua rata'y pytā).

The soil is sandy, with a lot of organic matter. The stream runs in a box, the water is shallow, forming a ravine of approximately three meters, in some sectors it runs on a rocky bed, forming small rapids. The water is whitish in color.

– RIPARIAN OR MARGINAL FOREST (BR) Santa Teresa e Zapallo

It generally develops on both banks of a watercourse. It is a forest about 18-20 meters high, with three layers. **Upper stratum:** *Anadenanthera colubrina* var. *cebilo* (kurupay kuru), *Copaifera langsdorfii* (Kupa'y), *Handroanthus ochraceus* (tajy sa'yju), *Peltophorum dubium* (yvyra pyta), *Inga uraguensis* (inga gusu), *Myracrodruon urundeuva* (urunde'y mi), *Sweetia frundeuticosa* (urunde'y mi) guasu), *Aspidosperma pyrifolium* (rosewood), *Guibourtia hymenaeifolia* (kuruñai), *Schefflera morototoni* (amba'y guasu), *Nectandra aff. cissiflora* (laurel ne), *Pseudobombax tomentosum* (mandyju ra), *Enterolobium timbouva* (timbo), **Middle stratum:** *Chrysophyllum gonocarpum* (Aguai), *Tapirira guianensis* (ka'a mbota), *Averrhoiodium paraguaiense*, *Myrtaceae*, *Salacia elliprotica* (Pakearuri brazilian) *gossypiosperma* (mbavy guasu), *Syagrus romanzoffiana* (pindo), *Attalea phalerata* (guacuri), *Protium heptaphyllum* (Yvyra ysy), *Campomanesia xanthocarpa* (guavira pyta), **Lower stratum:** *Genipa americana* (ñandypa guasu), *Cecropia pachystachya* *Neea* sp., *Guarea macrophylla* ssp. *spiciflora* (cedar), *Helietta apiculata* (yvyra ovi), *Citrus aurantium* (apepu), *Myrtaceae*, *Coussarea platyphylla*, *Casearia sylvestris* (donkey ka'a), *Gymnanthes discolor*, *Croton urucurana* (dragon's blood), *Garcinia brasiliensis* (pakichuri) catigua (catigua pyta), *Trichilia pallida* (katigua moroti) and *Helicteres lhotzkyana*.

On the banks of the Trementina and Hermosa Streams, the presence of tacuarales of *Guadua chacoensis* (takuara) of more than 15 meters in height have been registered.

The undergrowth is sparse. The species present are *Clavija nutans* (*tumby rasy poha*), *Trichilia elegans* (*katigua'i*), *Xylosma venosa* (*ñuati pyta*), *Psychotria carthagensis*, *Randia spp.* (*ñuati kurusu*), Epiphytes such as *Taumathophyllum undulatum* (*guembe*), *Microgramma persicariifolia*, *Phlebodium decumanum* (*calaguala*), terrestrial such as *Geophila repens*, *Dorsternia cayapia* ssp. *paraguariensis* (*tarope*) and *Oeceoclades maculata* (*burrito orchid*). Some lianas are *Pisonia aculeata* (*jagua pinda*), *Cissus erosa* (*parral saite*), *Smilax sp.*, *Cardiospermum grandiflorum* (*ysypo kamambu*) and *Paullinia pinnata*. The finding of *Lophophytum mirabile* (*yvoty yvy*), a root parasite registered in the riparian forest of the Negla stream, stands out. The soil is sandy and covered by abundant litter. The ravine is almost vertical about 3 to 4 m high. The Arroyo Negla'i was completely dry.

The presence of large trees cut down and abandoned in the forest of old date, in addition to stumps, was also recorded. Likewise, in the Riparian Forest of Arroyo Hermosa, signs of exploitation were recorded.

Cerradón (CD)

Is a plant formation characterized as an open semi-deciduous forest, presenting a height of up to 16 m, with three strata, the middle and lower strata being those with the highest density and diversity of species. Most of the tree species are typical of the formation and can also appear in more open formations such as the *Cerrado*. Most of the species are adapted to periodic burning, by presenting thick, corky and cracked bark. The understory is very open, with few epiphytes and lianas. Not much can be observed in the way of natural regeneration of tree species. The soil is sandy, shallow, covered by abundant leaf litter, and with rocky outcrops appearing in certain sectors. Four surveys were carried out in this formation and 92 species were recorded.

Reaches a height of 14 m – 16 m. **Upper stratum:** *Amburana cearensis* (trebol), *Terminalia argentea* (capitán), *Myracrodroon urundeava* (urunde'y mi), *Dilodendron bipinnatum*, *Enterolobium timbouva* (timbo), *Anadenanthera colubrina* var. *cebil* (kurupa'y kuru), *Pseudobombax tomentosum* (mandyju rã), *Tabebuia aurea* (paratodo), **Middle stratum:** *Averrhoiodium paraguaiense*, *Magonia pubescens* (vyvra hy'a), *Pseudobombax tomentosum* (mandyju rã), *Cordia americana* (guajayvi), *Acrocomia aculeata* (mbokaja), *Stryphnodendron rotundifolium* (barbatimao), *Myracrodroon urundeava* (urunde'y mi), *Zanthoxylum caribaeum* ssp. *rugosum* (tembetary hú), *Casearia gossypiosperma* (mbavy guasu), *Aspidosperma pyrifolium* (palo rosa), *Luehea divaricata* (ka'a oveti), *Sterculia striata*, *Dimorphandra mollis* (lorito pysã), *Trichilia pallens* (katigua morotí), *Handroanthus ochraceus* (tajy sa'yju), *Aspidosperma tomentosum* (kirandy del cerrado), *Acrocomia aculeata* (mbokaja), *Syagrus romanzoffiana* (pindo), *Astronium fraxinifolium* var. *glabrum* (urunde'y para morotí), *Cecropia pachystacya* (amba'y), *Priogymnanthus hasslerianus* (ka'a vera), *Annona neosalicifolia* (aratiku), *Agonandra brasiliensis*, *Sapium haematospermum* (kurupika'y), *Samanea tubulosa* (manduvi rã), *Helietta apiculata* (vyvra ovi) **Lower stratum:** *Acosmium subelegans*, *Erythroxylon suberosum*, *Rhamnidium elaeocarpum* (taruma'i), *Tabebuia roseo-alba* (tajy morotí), *Xylopia aromatica*, *Annona emarginata* (aratiku'i), *Tocoyena formosa*, *Plenckia populnea*, *Luehea divaricata* (ka'a oveti), *Casearia gossypiosperma* (mbavy guasu), *Ocotea minarum*, *Protium heptaphyllum* (vyvra ysy), *Dilodendron bipinnatum* (vyvra ruru), *Myrsine* sp. (kanelon), *Guettarda viburnoides*, *Coussarea platyphylla*, *Astronium fraxinifolium* var. *glabrum* (urunde'y para morotí), *Attalea phalerata* (guacuri), *Trichilia stellato-tomentosa*, *Celtis* sp.1 (juasy'y), *Duguetia furfuracea*, *Chrysophyllum marginatum* (pykasu rembi'u).

In the **understory** are present *Smilax* sp. (ju'a peka), *Bromelia balansae* (karaguata), *Bromelia serra* (karaguata), *Scleria* sp., *Piper* sp.2, *Forsteronia glabrescens* (ysypo kamby), *Bauhinia cheilantha*, B. cfr. *mollis*, *Forsteronia pubescens*, *Passiflora* sp.1, *Passiflora* sp.2., *Ruellia angustiflora*, *Croton* sp.4, *Randia calycina* (ñuatí kurusu), *Trichilia stellato-tomentosa*, *Dorstenia cayapia* ssp. *paraguariensis* (tarope), *Brosimum gaudichaudii*, *Campomanesia adamantium* (guavira mi), *Lasiacis* sp., *Bulbophyllum* sp., *Trichocentrum morenoi*, *Adiantum serrato-dentatum*, *Odontocarya tamoides* var. *canescens*, *Randia calycina* (ñuatí kurusu).

On the edges *Bauhinia* sp., *Prestonia tomentosa*, *Sapium haematospermum* (kurupika'y), *Myrsine* sp. (kanelón), *Jacaranda mimosifolia* (jakaranda), *Lygodium volubile*, *Annona emarginata* (aratiku'i).

Figure 25 – Cerradón - Soledad

Foto: (L. Pérez de Molas)

Figure 26 – Cerradón - San Liberato

Foto: (L. Pérez de Molas)

In the transition from Campo Cerrado to Cerradón, they are present *Cereus stenogonus* (tuna), *Bromeliabalansae* (karaguata), *Acrocomia aculeata* (mbokaja), *Dimorphandra mollis* (lorito pysa), *Agonandra brasiliensis*, *Tocoyena formosa*, *Aspidosperma tomentosum* (kirandy del cerrado), *Pouteria* sp. and *Duguetia furfuracea*,

The regeneration of the species was recorded: *Dilodendron bipinnatum* (yvyra ruru), *Trichilia clausenii* (katigua guasu), *Bauhinia forficata* ssp. *pruinosa* (pata de buey), *Tabebuia roseo-alba* (tajy morotí), *Allophylus edulis* (kokú), *Annona emarginata* (aratiku'i), *Guazuma ulmifolia* (kamba akã), *Cordia americana* (guajayvi), *Anadenanthera colubrina* var. *cebil* (kurupa'y kuru), *Amburana cearensis* (trebol), *Astronium fraxinifolium* var. *glabrum* (urunde'y para morotí), *Averrhoa paraguaiense*, *Pseudobombax tomentosum* (mandyju rã), *Syagrus romanzoffiana* (pindo), *Celtis* sp.1 (juasy'y), *Zanthoxylum rigidum* ssp. *hasslerianum* (tembetary), *Myrsine* sp. (kanelón), *Chrysophyllum marginatum* (pykasu rembi'u), *Cupania vernalis* (jagua rata'y pytã), *Trichilia stellato-tomentosa*, *Enterolobium timbouva* (timbo), *Trichilia catigua* (katigua pytã), *Tabebuia aurea* (paratodo), *Salacia elliptica* (pakuri brasilero).

The soil is sandy, with abundant litter, evidence of fires, invasion of *Megathyrsus maximus* (Jack.) B. K. Simon & S.W.L. Jacobs var. *maximus* (colonial pasture) in the clearings.

Campo Cerrado (CC)

Is a type of savanna formation, characterized by the dominance of sub-shrub species, with highly developed underground structures. Herbaceous species are present in proportionally lesser quantity and represented, among others, by numerous species of

grasses forming large patches. Evidence of periodic burning was noted. The soil is sandy, the topography is undulating and in certain sectors with rocky outcrops. A single survey was carried out in this formation and 74 species were recorded.

Savanna formation characterized by the dominance of subshrubs with a developed xylopod system, evidence of burns. The soil is sandy, with rocky outcrops (Granite) on the hills. The bedrock is present at a depth of about 10 cm, the terrain slopes steeply to the east.

Dominant species *Campomanesia adamantium* (*guavira mi*), *Angelonia integrerrima*, *Bidens chodatii*, *Butia* sp., *Acrocomia hassleri* (*mbokaja'i*), *Croton glandulosus*, *Croton* spp., *Rhynchospora setigera*, varias especies de Poaceae y Cyperaceae, *Arachis pfluegeae*, *Arachis nitida*, *Cenostigma marginatum*, *Senna paradycction*, *Borreria poaya*, *Eryngium sanguisorba*, *Ocimum ovatum*, *Microstachys hispida*, *Ruellia multifolia* var. *viscosissima*, *Aristida* sp., *Abildgaardia ovata*, *Annona dioica* (*aratiku*), *Oedochloa procurrens*, *Eriosema* sp., *Camprosema* sp., *Passiflora* sp.1, *Psidium* spp., *Cnidoscolus albomaculatus*, *Lippia lupulina*, *Ipomoea* spp., *Bulbostylis sphaerocephala*, *Evolvulus sericeus*, *Froelichia procera*, *Pouteria* sp., *Bromelia balansae* (*karaguata*), *Aspilia* sp., *Chrysolaena cognata* (*jagua rayi*), *Ayenia* sp., *Mandevilla petrea*, *M. aff. pohliana*, *Discocactus hartmanii*, *Lippia* sp., *Erythroxylon suberosum*, *E. cuneifolium* (*coca del monte*), *Buchnera* aff. *longifolia* among others.

Foto: (L. Pérez de Molas)

In San Liberato the predominant presence of *Talisia angustifolia* was recorded in this formation, occupying extensive areas, alternating with isolated bushes of various species of Poacea. In transitional areas with the Cerradón it was also observed, almost pure populations of *Pouteria* sp. y *Cyclolobium brasiliensis* and *Bromelia balansae* (*karaguata*), como así también regeneración de *Handroanthus ochraceus* (*tajy sa'yju*) and *Sapium haemathospermum* (*kurupika'y*).

Relief:

– Cerrado Field. In Hermosa

It is a satanic formation characterized by the predominance of shrub and sub-shrub species with important enduring root systems such as xylopods. They generally develop on sandy soils and are subject to periodic burning. Herbaceous species are also present, although to a lesser extent.

Some characteristic species are: *Campomanesia adamantium* (*guavira mi*), *Croton campestris*, *Duguetia furfuracea* (*aratiku*), *Orthopapus angustifolius*, *Vernonantura chamaedrys* (*typycha moroti*), *Anacardium humile* (*kaju'i*), *Talisia angustifolia*, *Eryinustengium ebniiifolia*, *Erynumidium ebniiifolia*, *Spermacoce verticillata* (*runner typycha*), *Croton glandulosus*, *Mandevilla petraea*, *Oxalis renifolia*, *Annona dioica* (*aratiku*), *Ayenia tomentosa*, *Arachis sp.*, *Desmodium barbatum* (*taha taha*), *Orthopapus angustifolius*, *Mimosa xanthocentra*), *M. juiskeri*, *Microstachys hispida*, *Calliandra brevicaulis*, *Turnera grandiflora*, *Psidium spp.*, *Allagoptera sp.*, *Butia sp.*, *Waltheria sp.*, *Melochia sp.*, *Schizachyrium sp.*, *Lygodium venustum*, *L. volubile*, *Indigofera sp.*, *Rhynchosia sp.*, *Zornia spp.*, *Indigofera elegans*, *Ximenia intermedia*, *Pterocaulon spp.*, *Evolvulus sericeus*, *Aeschynomene spp.*, *Adiantum serrato-dentatum*, *Riedeliella graciliflora*, *Cnidoscolus albomaculatus* and *Synedrellopsis grisebachii*.

Figure 29 – Cerrado Field in a pastureland of *Urochloa brizantha*.
Hermosa. 4.4.2021

Foto: (L. Pérez de Molas)

Figure 30 – Cerrado Field. Hermosa.
4.4.2021

Foto: (L. Pérez de Molas)

The formation is in a degraded state, since at present it is a pasture of *Urochloa brizantha*, in Hermosa, subjected to overgrazing. The Cerrado species that have been recorded in this pasture indicate that the original vegetation has been this one. Other characteristics that add to the degradation are the presence of a lot of bare soil, a network of heavily eroded and compacted trails, traces of periodic burning, abundant cattle droppings, and large anthills. Some active wildlife burrows were also recorded.

Relays:

EM 3 H Coordinates: 22 ° 31'13.6 "S - 56 ° 56'44.0" W Altitude: 171 masl

EM 4 H Coordinates: 22 ° 27'13.3 "S - 56 ° 54'58.5" W Altitude: 215 masl

Dirty Field or Campo Sucio (CS)

Is a phytophysiology of the *Cerrado*, which also presents a predominance of sub-shrub species forming extensive patches of several individuals, with characteristic species of the formation and some typically ruderal. Evidence of extensive grazing is noted, such as bare and compacted soil. It occupies the higher parts of the terrain, with undulating topography, sandy soils, and with little leaf litter.

In Gavilán, a formation characterized by the presence of species with a maximum height of 1.6 m, bushy vegetation, the soil is sandy, semi-covered with patches of *Paspalum* sp. (Cavaju grass), bushes forming large clumps, shows evidence of entry of cattle and trails.

In San Liberato, with fewer species, evidence of degradation, such as a lot of bare soil, compacted, overgrazed, browsed and traces of burning.

The characteristic species recorded *Talisia angustifolia*, *Anacardium humile* (*kaju'i*), *Byrsonima* sp., *Pouteria* sp., *Zornia* sp.1, *Annona dioica* (*aratiku*), *Schinus weinmannifolius* (*molle'i*), *Duguetia furfuracea* (*aratiku hata*), *Cnidoscolus albomaculatus*, *Annona nutans* (*aratiku ñu*), *Campomanesia adamantium* (*guavira mi*), *Annona emarginata* (*aratiku'i*), *Syagrus campylospatha* (*jata'i mi*), *Calliandra brevicaulis* var. *brevicaulis* (*niño azote*), *Orthopapus angustifolius*, *Adesmia* sp., *Psidium* sp.2, *Tocoyena formosa*, *Croton glandulosus*, *Croton* sp.1, *Forsteronia pubescens*, *F. glabrescens* (*ysypo kamby*), *Eriosema* sp., *Scoparia dulcis* (*typycha kuraty*), *Melochia villosa*, *M. parvifolia*, *Spermacoce verticillata* (*typycha corredor*), *Scleria* sp., *Sida cordifolia* (*malva blanca*), *Andropogon lateralis* (*kapi'i pytā*), *Hypsis* spp., *Desmodium* sp.1 (*taha taha*), *Acisanthera* sp., *Tibouchina* sp., *Pfaffia* sp., *Bromelia balansae* (*karaguata*), *Evolvulus sericeus*, *Trixis* sp., *Rhynchospora* sp.1, *Arachis nitida*, *Arachis paraguariensis* ssp. *paraguariensis*, *Eupatorium* sp.1, *Angelonia integriflora*, *Mandevilla petrea*, *Bidens gardneri*, *Dorstenia brasiliensis* (*tarope*), *Paspalum* sp.3 (*kapi'i pe kavaju*) among other.

It is very common to observe the presence of islets in contact with the sabanoid formations. Some characteristic species in these islets are: *Zanthoxylum rigidum* ssp. *hasslerianum* (Tembetary), *Myrsine* sp. (Kanelon), *Chrysophyllum marginatum* (Pykasu rembi'u), *Chomelia obtusa*, *Dimorphandra mollis* (Lorito pysa), *Tabernaemontana catharinensis* (Sapirangy), *Acanthocladus albicans*, *Psidium* sp.1 (Arasa), *Bidens pilosa* (Kapiuna), *Stachytarpheta cayennensis* (Tatu ruguai), *Cestrum* sp., *Solanum* sp., *Spermacoce verticillata* (Typycha corredor), *Melochia parvifolia*, *Mimosa* sp.2 (Jukeri), *Smilax* sp. (Ju'a peka) and in border areas, pure populations of *Bromelia balansae* (Karaguata).

In Zapallo Phytophysionomy corresponds to a savanna characterized by the presence of subleñosas and herbaceous, mainly, species of Poaceae, Asteraceae, Euphorbiaceae, Fabaceae. The Poaceae cover a large part of the soil surface, with their large clumps. Some species present are *Talisia angustifolia*, *Mandevilla petraea*, *Mimosa debilis* (jukeri), *Spermacoce verticillata* (typcha corredor) *Andropogon lateralis* (kapi'i pyta), *Sida linifolia*, *Pfaffia* sp., *Desmodium barbatum* (taha taha), *Croton glandulosus*, *Microstachys hispida*, *Aeschynomene elegans*, *Oedochloa procurrens*, *Solanum viarum* (mboi rembi'u), *Arachis* sp., *Aristida* sp., *Adiantum serrato-dentatum*, *Ruellia* sp., *Annona dioica* (aratiku), *Hyptis* spp.,

Figure 33 – Dirty field or “Campo sucio” - Zapallo.

Foto: (L. Pérez de Molas)

It develops in high parts of the terrain, with a gentle slope, where islets of different sizes and biodiversity alternate. Some species present on the islets are: *Cordia glabrata* (peterevy moroti), *Machaerium hirtum*, *Sapium haemathospermum* (kurupika'y), *Acosmium subelegans*, *Acrocomia aculeata* (mbokaja), *Tapirira guianensis*

(camboata), *Handroanthus Tajtaytaphyns huu* (aratiku wildebeest). At the edges of the islets are *Bromelia balansae* (karaguata) and *Syagrus campylospatha* (jata'i mi).

Relief:

EM 4 Z Coordinates: 22°31'18.5" S - 56°36'35.5" W Altitude 163 msnm

High Savanna (SA)

Is formation occupies the highest parts of the terrain, which are contiguous with forest formations. They present a mainly herbaceous cover with predominance of grasses, mainly *Elionurus muticus* (Espirillo) and *Aristida* sp., as well as other herbaceous species and some trees either as isolated individuals or in small groups or patches. They are prone to extensive grazing and periodic burning. The presence of large patches was also recorded, mainly of *Syagrus campylospatha* (Jata'i mi). The soil is sandy. A single survey was carried out in this formation and 22 species were recorded.

Non-floodable savanna with dominance of *Elionurus muticus* (espartillo), forming large clumps, accompanied by *Aristida* sp., and isolated specimens of *Attalea phalerata* (guacuri), *Aspidosperma tomentosum* (kirandy del cerrado), *Butia* sp., *Annona dioica* (aratiku), *Pouteria* sp., *Talisia angustifolia*, *Sapium haemathospermum* (kurupika'y), *Syagrus campylospatha* (jata'i mi), *Melochia villosa*, *Arachis* spp., *Croton* sp.1.

In some places small islands of *Acrocomia aculeata* (mbokaja), *Ocotea diospyrifolia* (Laurel sa'yju), *Sapium haemathospermum* (kurupika'y), *Cereus stenogonus* (tuna), *Enterolobium timbouva* (timbo), *Cecropia pachystachya* (amba'y), *Tocoyena formosa*. The edges are colonized by *Bromelia balansae* (karaguata).

Figure 34 – High savanna in San Liberato

Foto: (L. Pérez de Molas)

Foto: (L. Pérez de Molas)

It develops on sandy soils and with higher topography. It shows traces of burning.

Relief:

PO2L Coordinates: 22 ° 38 '57.8" S 56 ° 52' 28.6 " W, Altitude 177 meters above sea level

In Zapallo and Santa Teresa the formation characterized by a herbaceous stratum with a predominance of Poaceae with large, herbaceous and subleño bushes, alternating with isolated trees of *Acrocomia aculeata* (mbokaja), *Machaerium hirtum*, forming small

groups, *Salacia elliptica* (Brazilian pakuri) and shrubs as *Tocoyena formosa*. Likewise, phytophionomy includes islets of different sizes and biodiversity.

Characteristic species: *Elionurus muticus* (espartillo), *Hyptis* spp., *Arachis* spp., *Eupatorium* sp., *Melochia* aff. *pilosa*, *Adiantum serrato-dentatum*, *Lygodium volubile*, *Rhynchospora nervosa*, *Mimosa xanthocentra* (jukeri), *Aeschynomene elegans*, *Chamaecrista* aff. *nictitans*, *Scleria distans*, *Crotalaria maypurensis*, *sauvagesia erecta*, *Pterocaulon alopecuroides*, *Buchnera longifolia*, *Microstachys hispida*, *Zornia* sp., *Bauhinia* sp., *Croton campestris*, *C. andinus*, *Sida linifolia*, *Mimosa debilis* (jukeri), *Chamaecrista flexuosa*, *Mandevilla petraea*, *Schizachirium* sp., *Andropogon selloanus*, *Aristida* sp., *Oedochloa procurrens*, *Lippia* aff. *turnerifolia* var. *turnerifolia*, *Evolvulus sericeus*, *Mimosa dolens* (jukeri), *Polygala linoides*, *Desmodium barbatum* (taha taha), *Stachytarpheta cayennensis* (tatu ruguai), *Acisanthera alsinaefolia*, *Oxalis renifolia*, *Malvastrum coromandelianum*, *Andropogon lateralis* (kapi'i pyta), *Paspalum* spp., *Croton glandulosus*, *Spermacoce verticillata* (typcha corredor).

The species of *Pterocaulon lanatum* and *Sidastrum paniculatum*, *Solanum granulosum-leprosum* (hu'i moneha) are the dominant invasive species in overgrazed and degraded pastures.

The islets have a height of 5 to 8 meters, with arboreal, shrub and herbaceous stratum. The species present are: *Sapium haemathospermum* (kurupika'y), *Ocotea diospyrifolia* (aju'y sa'yju), *Zanthoxylum rigidum* ssp. *hasslerianum* (Tembetary), *Casearia sylvestris* (Donkey ka'a), *Chrysophyllum marginatum* (Pykasu rembi'u), *Myrtaceae*, *Handroanthus impetiginosus* (Pink Lapacho), *Genipa americana* (ñandypa guasu), *Handroanthus ochraceus* (Tajinif, *Astronium satronium*'yju) var. *glabrum* (urunde'y para moroti), *Tocoyena formosa*, *Xylosma venosa* (ñuati pyta), *Psidium* spp. (arasa mbaja), *Chomelia obtusa*, *Varronia* sp., *Randia* spp. (ñuati kurusu). The supporting lianas and shrubs are: *Paullinia pinnata* and *Aegiphilla verticillata*. The edges are colonized by *Bromelia balansae* (karaguata).

Foto: (L. Pérez de Molas)

They occupy the highest places on the ground. The soil is sandy or clayey and very dry. There are traces of burning, trails and cattle feces.

The pasture with *Urochloa brizantha* pasture has a high density of adult specimens and natural regeneration of *Attalea phalerata* (*guacuri*), isolated individuals of *Sapium haemathospermum* (*kurupika'y*), *Anadenanthera colubrina* var. *cebil* (*kurupa'y kuru*), *Helietta apiculata* (*yvyra ovi*), *Machaerium aculeatum* (*yvyra tanimbú*), *Luehea divaricata* (*ka'a oveti*), *Ficus* sp. (*handsome'y*), *Lonchocarpus pluvialis*, *Acosmium subelegans*, *Zanthoxylum riedelianum* (*Tembetary sa'yju*), among others.

Floodable Savanna (SI)

This formation occupies the lowest parts of the terrain and borders with the forest formations. They present a mainly herbaceous cover with a predominance of grasses forming large patches, as well as other herbaceous aquatic and palustrine plants, and some trees either as isolated individuals or in groups forming small patches. In certain sectors, the presence of large patches, mainly of *Syagrus campylospatha* (*Jata'imi*), were also recorded. At other sites, the presence of isolated individuals of *Copernicia alba* (*Karanda'y*) and *Acrocomia aculeata* (*Mbokaja*) was observed, as well as *Machaerium hirtum* at an arboreal level. Within certain sectors of the localities surveyed, the presence of bodies of water was observed, presumably formed some time ago by the damming of small water courses, and that have since been colonized by aquatic and/or palustrine plant species, either free-flooding or bottom-rooted, depending on the depth of the water. Based on the verification of certain evidence, this formation is prone to extensive grazing as well as periodic flooding and burning. Five surveys were carried out in this formation and 114 species were recorded.

In Gavilán, in the *Eucalyptus camaldulensis* plantation area, approximately 10 years old, with grasses of up to 80 cm and woody growing in isolation, up to 2 m. *Pleurophora saccocarpa*, *Ludwigia* sp., *Echinodorus grandiflorus* (*spoonbill*), *Pontederia cordata* (*camalote*), *Heteropterys* sp., *Aeschynomene* sp. 1, *Paspalum* spp., *Eupatorium* spp., *Eleocharis elegans*, *Aspilia montevidensis*, *Caperonia aff. castaneifolia*, *Cuphea lysimachioides* (*ysypo pere*), *Rhynchospora* spp., *Melochia simplex* among others.

In similar formation in Gavilán, on gray, humid sandy-clayey soil (fine sand), species of the Poaceae family of the genus *Paspalum* sp were also recorded. growing in large clumps, with inflorescences that reach up to 2.5 m. Other registered species were: *Psidium* sp. 3 (*arasa*), *Sisyrinchium* sp., *Stylosadores* sp., *Setaria* sp., *Annona nutans* (*aratiku*), *Rhynchospora* sp., *Oedochloa procurrens*, *Imperata brasiliensis* (*jahape*), *Mimosa* spp. (*jukeri*), *Eleocharis* spp., *Hyptis* spp., *Cipura paludosa* ssp. *boliviensis*, among others.

The presence of trails was observed, surrounded by gallery forest and low forest of 8-10m. Isolated specimens of *Sapium haemathospermum* (*kurupika'y*), *Cecropia pachystachya* (*amba'y*), *Myracrodruon urudeuva* (*regeneration*), *Allophylus edulis*

(*kokū*), *Schinus weinmannifolius* (*molle'i*), *Acrocomia aculegaurisia* (*jamaica mbokayaata* (*jambokaya para i*)).

The formation of this category observed in Soledad, presented as dominant the species of the Poaceae family, with heights of 0.9-1 m and inflorescences of up to 2.5 m. The soil is dark, blackish, humid and in higher parts with wide and deep cracks and traces of burning.

The following were recorded: *Paspalum sp.*, *Lobelia aff. nummularioides*, *Ludwigia hassleriana*, *L. nervosa*, *Rhynchospora spp.*, *Cyperus spp.*, *Lippia sp.*, *Fimbrystylis sp.*, *Melochia parvifolia*, *Mikania sp.*, *Acalypha sp. 2*, *Heteropteris sp.*, cfr. *Hymenachne sp.*

In areas of higher topography, the following were recorded: *Stillingia aff. salpingadenia*, *Desmodium sp. 2*, *Oxypetalum sp.*, among other species.

In Trementina , the presence of a vegetated lagoon was recorded, with a surface area of 80 x 50 m, whose possible origin was the damming of a water channel. The following bottom-rooted species were surveyed: *Eleocharis elegans* and *Eleocharis sp.* (dominant), patches of *Pontederia azurea* (*aguape puru'a*); on the edge, but within the water *Utricularia sp.*, *Lemna minuta*, *Pontederia cordata* (*camalote*) and *Nymphoides verrucosa*. *Ludwigia sp.*, *Scoparia dulcis* (*typycha kuratu*), *Phyllanthus niruri* (*para'i*), *Setaria sp.*, *Hymenachne amplexicaule* (*camalotillo*), *Sida cordifolia* (white mallow), *Polygonum sp.* . (*ka'a tai*), *Aeschynomene sp.*, *Eupatorium sp.* 3.

Figure 37 – Floodplain Savanna in Soledad

Foto: (L. Pérez de Molas)

Figure 38 – Marsh aquatic vegetation in body of water in Trementina

Foto: (L. Pérez de Molas)

In places with higher topography, *Sapium haematospermum* (*kurupika'y*), *Cecropia pachystachya* (*amba'y*), *Sorocea sprucei* ssp. *saxicola* (*Maria molle*), *Tocoyena formosa*, *Acrocomia aculeata* (*mbokaja*), *Vitex cymosa* (*taruma*), *Ocotea diospyrifolia* (*Laurel sa'yju*), *Bromelia balansae* (*karaguata*).

– FLOODABLE SAVANNA WITH FOREST ISLANDS In Santa Teresa

It is characterized by presenting a dominant herbaceous layer formed mainly by Poaceae and Cyperaceae species growing in large clumps and often reaching a height of more than 1 meter. The characteristic species are: *Cyperus giganteus* (*piri guasu*), *Paspalum intermedium*, *Aeschynomene* aff. *americana*, *A. elegans*, *Pontederia cordata* (*kamalote*), *Bytneria* sp., *Vernonanturna brasiliiana*, *Commelina diffusa* (*santa lucia hovy*), *Acalypha* sp., *Ludwigia nervosa*, *L. filiformis*, *L. hassleriana*, *L. sericea*, *Cuphea*

lysimachioides (ysypo pere), *Rhynchospora* spp., *Hetropterys glabra*, *Melochia parvifolia*, *Acisanthera alsinaefolia*, *Tibouchina* sp., *Schultesia* sp., *Nymphoides indica*, *Echinodorus* sp., *Sauvagesia erecta*, *Angelonia integriflora*, *A. salicarifolia*, *Polygala linoides* var. *linoides*, *P. molluginifolia*, *Lippia* aff. *turnerifolia* var. *turnerifolia*, *Stemodia* spp., *Corchorus argutus*, *Cipura paludosa* ssp. *boliviensis*, *Cantinoa althaeifolia*, *Hydrolea elatior*, *Caperonia* aff. *castaneifolia*, *C. palustris*, *Lessingianthus rubricaulis*, *Campuloclinium macrocephalum*, *Eryngium ebracteatum*, *Justicia laevilinguis*, *Schizachyrium* spp., *Eleocharis* spp., *Polygonum* spp. Among the lianas stand out *Mikania* sp. y *Rhabdadenia ragonesei*.

They occupy the intermediate altitude zones between the high savanna and the flooded savanna. The soil is clayey, dark, with abundant organic matter, and they suffer floods (September to November) and periodic burns, mainly in the autumn-winter.

In the lower areas, and with permanent water, there appear almost pure populations of *Thaumatophyllum undulatum* (guembe) and species of Poaceae (Kapi'i pe'y) and Cyperaceae, such as *Cyperus giganteus* (piri guasu). In some places isolated specimens of *Sesbania exasperata*, *Machaonia brasiliensis* and *Helicteres gardneriana* are present.

These areas also represent paddocks with implanted pastures of *Urochloa humidicola*. Presents evidence of degradation such as deep tracks, heavily eroded trails, and cattle droppings. They are breeding paddocks, with permanent load.

Alternating with the flooded savanna and in higher places, almost always with the presence of one to three ant hills with their respective burrows, are the islets, with variable shape, size and biodiversity, characterized by floristic elements of the cerradones such as *Dipteryx alata*, *Dilodendron bipinatum*, *Xylopia brasiliensis*, *Acrocomia aculeata* (mbokaja), *Sapium haemathospermum* (kurupika'y), *Acosmum subelegans*, *Guibourtia hymenaeifolia* (kuruñai), *Handroanthus impetiginosus* (lapacho rosado), *Sorocea sprucei* (maría molle), *Copaifera langsdorffii* (kupa'y), *Machaerium hirtum*, *Astronium fraxinifolium* var. *glabrum* (urunde'y para moroti), *Anadenanthera peregrina* (kurupa'y ita), *Aspidosperma quebracho-blanco* (quebracho blanco), *Sideroxylon obtusifolium* (guajayvi rai), *Ocotea diospyrifolia* (aju'y sa'yju), *Cereus stenogonus* (tuna). Los arbolitos y arbustos presentes son *Randia* spp. (ñuati kurusu), *Myrsine* sp. (kanelón), *Genipa americana* (ñandypa guasu), *Monteverdia ilicifolia* (kangorosa), *Casearia sylvestris* (burro ka'a), *Tabernaemontana catharinensis* (sapiranguy), *Tocoyena formosa*, *Psidium* spp., *Cestrum* sp., *Trichilia stellatotomentosa*, *Celtis* sp. (juasy'y), *Xylosma venosa* (ñuati pyta), *Melochia* sp., *Scleria* sp. Among the lianas, *Forsteronia glabrescens* and *F. pubescens* (ysypo kamby), *Paullinia pinnata*, *Smilax* sp., *Tanaecium* sp., *Bonamia* aff. *subsessilis*, *Janusia guaranitica*, *Smilax* sp., *Passiflora cincinnata* (mburucuja), among others. The edges are generally colonized by *Bromelia balansae* (karaguata) and *Stachytarpheta cayennensis* (tatu ruguai).

In San Liberato the formation that is characterized by being subjected to floods, periodic burning and extensive grazing. The dominant species in the upper stratum is *Copernicia alba* (karanda'y) (Fig. 21), accompanied by very isolated individuals of *Acrocomia aculeata* (Mbokaja), *Machaerium hirtum*, *Peltophorum dubium* (yvyra pytã), *Copaifera langsdorffii* (kupa'y) , *Terminalia triflora* (guajayvi sa'yju), *Sapium haemathospermum* (kurupika'y), *Zanthoxylum hirtum* ssp. *hassleri* (Tembetary), *Cereus stenogonus* (Prickly Pear), *Tocoyena formosa*. In some sectors, pure populations of *Talisia angustifolia*, *Bromelia balansae* (karaguata), *Syagrus campylospatha* (jata'i mi), *Annona nutans* (aratiku), *Thaumatophyllum undulatum* (guembe) and *Annona dioica* (aratiku) were observed.

Figure 40 – Sabana inundable de *Copernicia alba* en San Liberato.

Foto: (L. Pérez de Molas)

The herbaceous stratum is continuous and dominated by several species of the Poaceae family, including *Aristida* sp., In particular the presence of several species and *Arachis* spp.

FLOODED SAVANNA WITH “EMBALSADO” (SIn) In Zapallo

It constitutes a large wetland characterized by the dominance of few species, including Cyperaceae and Fabaceae, mainly *Aeschynomene* aff. *americana* growing in isolation. It has permanent water and an organic substrate that produces movement when walking on it. Some species also registered are: *Eleocharis* spp.; *Utricularia* spp., *Hibiscus sororius*, *Ludwigia nervosa*, *Nymphoides indica*, *Pontederia* aff. *subovata*.

Foto: (L. Pérez de Molas)

EMBALSADO In Zapallo

Inserts in a few sectors are dammed from 10 to 15 meters in diameter, colonized mainly by woody plants of the Onagraceae, Fabaceae and Malvaceae families. Some recorded species are *Habenaria* aff. *repens*, *Mayaca sellowiana*, *Myrsine* sp., *Cecropia pachystachya* (amba'y), *Bacopa* aff. *salzmannii*, Pteridophyta, Melastomataceae, *Xyris* sp., *Hydrolea* aff. *spinosa* var. *paraguayensis*.

AQUATIC VEGETATION IN WATER BODIES

In the bodies of water of variable size and depth, and dispersed in all the study sites, established mainly for livestock consumption, the aquatic-marsh vegetation develops, among which amphibians, rooted in the bottom and the free floating. Some registered

species are: Eleocharis spp., Pontederia azurea (aguape), Nymphoides indica, Limnocharis flava, Hydrocleys nymphoides, Ludwigia nervosa, Gymnocoronis spilantoides, Marsilea sp. Almost pure populations of Polygonum spp. Develop at the edges, among others.

References:

MADES (National) EN (Endangered) species categorized by the IUCN as "EN, CR, DD"; AE (Threatened with Extinction); species categorized as "VU" by the IUCN.

CITES: Appendix I: species with the highest degree of danger among species of fauna and flora, in danger of extinction. CITES prohibits international trade in specimens of these species, except when the import is for non-commercial purposes, i.e. for scientific research. Appendix II: species that are not necessarily threatened with extinction but could become so unless their trade is strictly controlled.

*Not all common names were identified.

Table 8 – List of species with known uses

Nº	Species and author	Common name in Spanish or Guarani	Uses
1	<i>Monvillea cavendishii</i> (Monv.) Britton & Rose	Cola de León	Co
2	<i>Garcinia brasiliensis</i> Mart.	Pakuri	Co
3	<i>Erythroxylum cuneifolium</i> (Mart.) O.E. Schulz	Coca del Campo	Co

6.1.4 Terrestrial Fauna Seasonal Results

The monitoring campaign was carried out in the rainy season, in november 2020 and february 2021. The dry season monitoring campaign was carried out in may 2021.

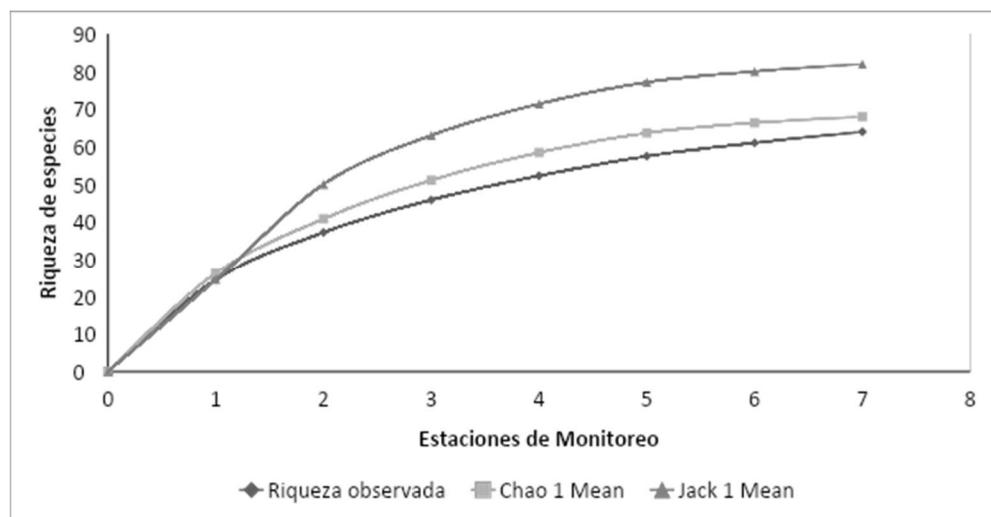

6.1.4.1 Primary Seasonal Data – Rainy Season

Ichthyological survey

In terms of abundance, *Odontostilbe pequira* is the most frequent fish species in the seven sampling areas (properties) with 470 (26.14%) individuals, followed by *Corydoras aeneus* (153 - 8,5%) y *Moenkhausia dichroura* (108 – 6%). There are eight species for which only one individual was captured during the entire monitoring. The 64 species of ichthyofauna recorded represent 21% of the Paraguayan ichthyofauna, according to the checklist of Koerber, Vera & Reis (2017), and together with the methodology used, have been included in the photographic record.

The Characidae family is the richest with 18 species (Ichthyology (fish) annex). With regard to threatened species, it can be mentioned that *Potamorrhaphis eigenmanni* is VU (Vulnerable) according to MADES Resolution 1563/09 and *Odontostilbe pequira* (mojarra) is categorized by IUCN as LC (Least Concern) at a regional level. Santa Teresa sampling area held the highest richness (see List of species by sampling areas with 32 species, while the San Liberato sampling area/site presented the lowest richness with only 10 species. The mojarra *Moenkhausia dichroura* was the only species to be present at all of the ranches, while *Odontostilbe pequira* is the most abundant species. Ten species (20%) are used for subsistence fishing, while seven are used in commercial fishing and 18 are used for ornamental purposes (see Usage of recorded species in different fishing practices. likely that fish from the Heptapteridae family (catfish) could typically be considered the most desirable species in terms of subsistence fishing.

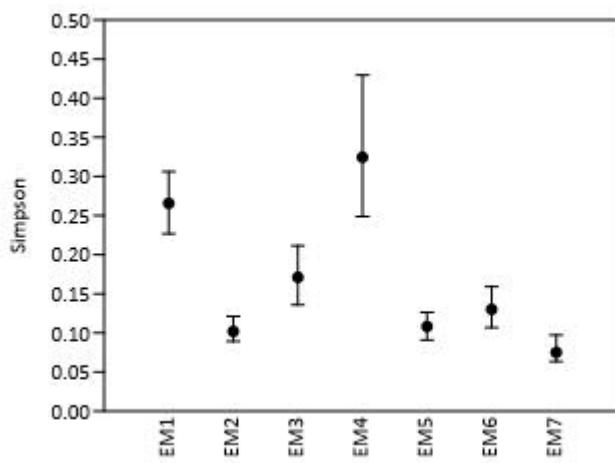

Figure 48 – Species accumulation curve

EM1= Gavilán; EM2= Trementina; EM3= Soledad; EM4= San Liberato; EM5= Santa Teresa; EM6= Zapallo; EM7= Hermosa.

Through the species richness estimators, using the data obtained in the surveys carried out (64 species) in the study area, it is estimated that approximately 68 species (95% confidence limits: 64.85 - 82.91 species) could be recorded in the area, with the same sampling effort (Chao1). However, the species accumulation curve obtained through the Chao1 and Jack1 estimators (Colwell 2005) shows that species with greater sampling effort will still continue to be found due to the fact that the curve does not reach a plateau, According to these estimators, between 78.04% and 94.11% of the expected species were observed.

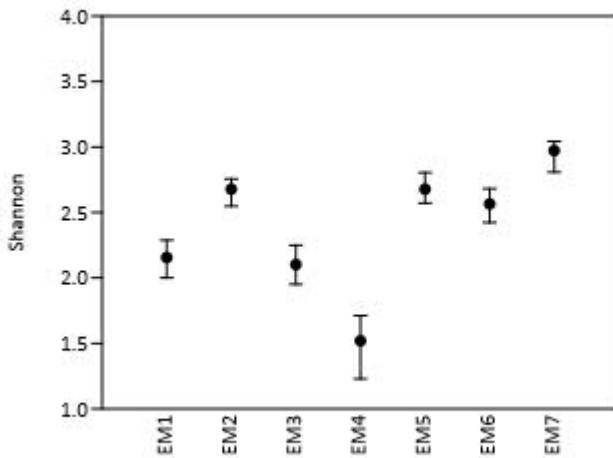

Figure 49 – Simpson's Dominance

EM1= Gavilán; EM2= Trementina; EM3= Soledad; EM4= San Liberato;
EM5= Santa Teresa; EM6= Zapallo; EM7= Hermosa.

The Simpson index represents the probability that two individuals, within a habitat, selected at random, belong to the same species. In other words, the closer the value of this index is to unity, there is a greater possibility of dominance of a species and a population; and the closer the value of this index is to zero, the greater is the biodiversity of a habitat (Magurran, 1988). According to this index, the dominance fluctuates between 0.07522 (EM7) and 0.3245 (EM2).

Figure 50 – Equity Index (Shannon-Wieber)

EM1= Gavilán; EM2= Trementina; EM3= Soledad; EM4= San Liberato;
EM5= Santa Teresa; EM6= Zapallo; EM7= Hermosa.

The Shannon index expresses the uniformity of the importance values across all the species in the sample; and it measures the average degree of uncertainty in predicting to which species an individual chosen at random from a collection belongs (Magurran, 1988; Peet, 1974; Baev and Penev, 1995). It assumes that individuals are randomly selected and that all species are present in the sample. It acquires values between zero, when there is only one species, and the natural logarithm of S ($64 = 4.158$), when all species are represented by the same number of individuals (Magurran, 1988). In this first monitoring, the values fluctuate between 1.52 (EM4) and 2.973 (EM2).

Table 9 – The ichthyofauna and its taxonomy

	<i>Species</i>	Author	Common name	Distribution
ACTINOPTERI				
CHARACIFORMES				
Acestrorhynchidae				
1	<i>Acestrorhynchus pantaneiro</i>	Menezes 1992	Pirá jaguá	Native
Serrasalmidae				
2	<i>Serrasalmus marginatus</i>	Valenciennes 1837	Piraña	Native

Herpetological survey

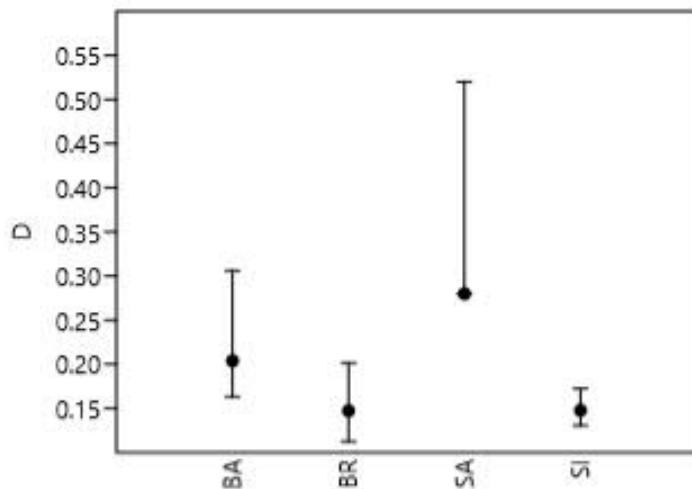

A total of 31 species (24 amphibians and 7 reptiles) were recorded along the transects, while another nine amphibians and 14 reptile species were recorded during random searches and at breeding grounds in the entire study area. This represents 61% of the amphibian species and 23% of the reptile species within the Concepción and Amambay Departments, combined (Brusquetti & Lavilla 2006, Brusquetti et al. 2007, Cacciali et al. 2016, Cacciali & Kohler 2018, Smith et al. 2012, Weiler et al. 2013). It is expected that the occurrence of at least another one amphibian species and twelve more reptile species is highly likely, based on the fact that these had already been observed during the evaluations of nearby conservation units, such as the Paso Bravo National Park (Altervida 2003), San Luis National Park (Rojas-Bonzi et al. 2020), Tagatiya Mi Nature Reserve (Concepción et al. 2004), and the Estancia Estrella Ranch (*Red Paraguaya de Conservación en Tierras Privadas*, 2008).

Figure 56 – Species accumulation curve for amphibians based on each sampling unit (transects with repetitions)

Using the data obtained in the herpetological survey where 22 species of amphibians were found, the Chao 1 and Jack 1 species richness estimators calculate that 26 species (95% confidence limits: 22.67 - 47.71 species, could be found with the same sampling effort. As the curve does not reach asymptotes in the species accumulation curves, it is suggested that with a greater sampling effort, even more species not previously registered will be found. According to the estimators, between 73.52% and 84.09% of the species likely to occur in the area were observed.

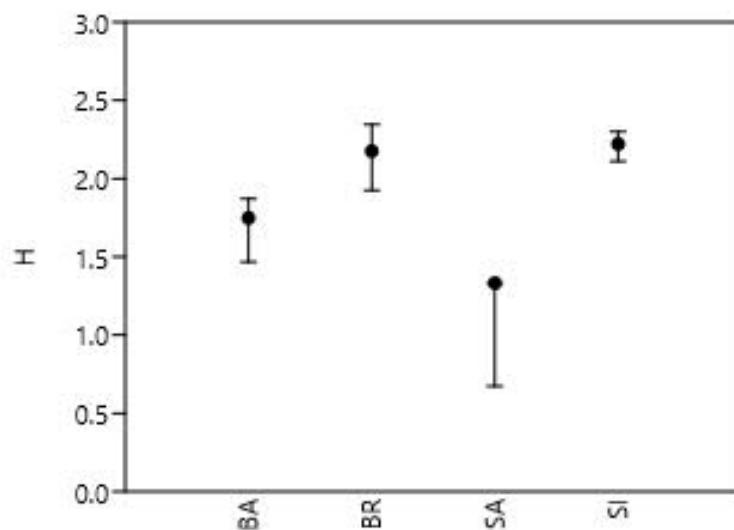

Figure 57 – Simpson Dominance

BA: Degraded High Forest; BR: Riparian Forest; SA: High Savanna; SI: Floodable Savanna.

The Simpson index representing the probability that two individuals in a population are randomly selected and belong to the same species, expresses how equitable the number of individuals of the species found is (Magurran, 1988). The closer to 1 (one) the index is, the greater the dominance of common species, and the closer to 0 (zero), the more equitable the population. In the BA, BR, SA and SI formations a mean dominance can be observed that fluctuates between 0.28 (SA) to 0.15 (BR), so that a dominance of common species and low rates of encounter of rare species.

Figure 58 –Equity Index

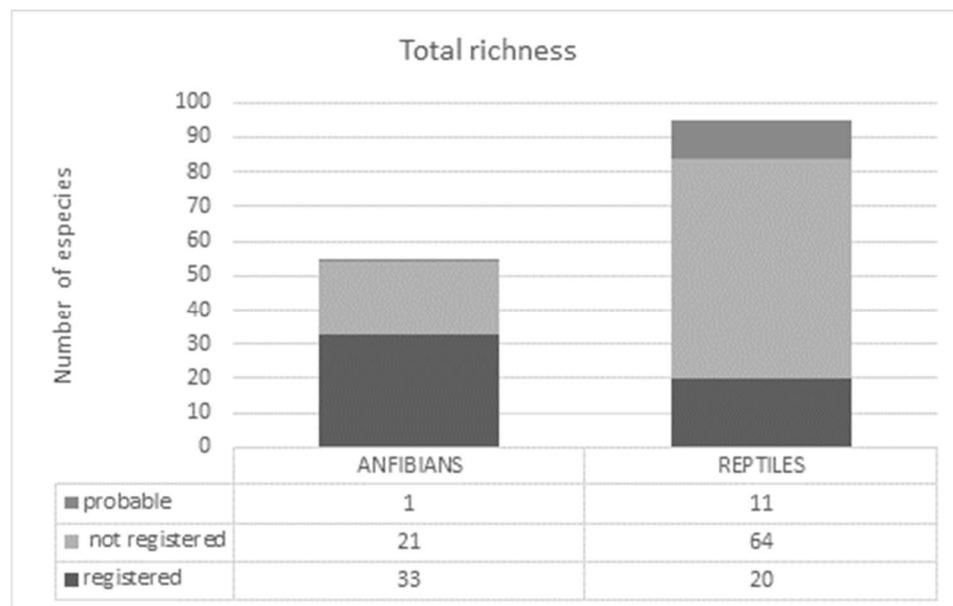

BA: Degraded High Forest; BR: Riparian Forest; SA: High Savanna; SI: Floodable Savanna.

On the other hand, the Shannon index expresses the uncertainty to predict to which species an individual found at random from a sample in the population will belong. The

index has a value of 0 (zero) when the population sample contains only one species, and has maximum values when all the species assumed to be present are equitably represented (Magurran, 1988). In this case, the index varies between 1.3 (SA) and 2.2 (SI). This complements the Simpson index, which shows little equity in the representation of species, and also a low representation of them in the SA, in particular.

Figure 59 – Number of species listed for the departments: not recorded during fieldwork, recorded during fieldwork, possibly present (recorded during REA of nearby conservation units)

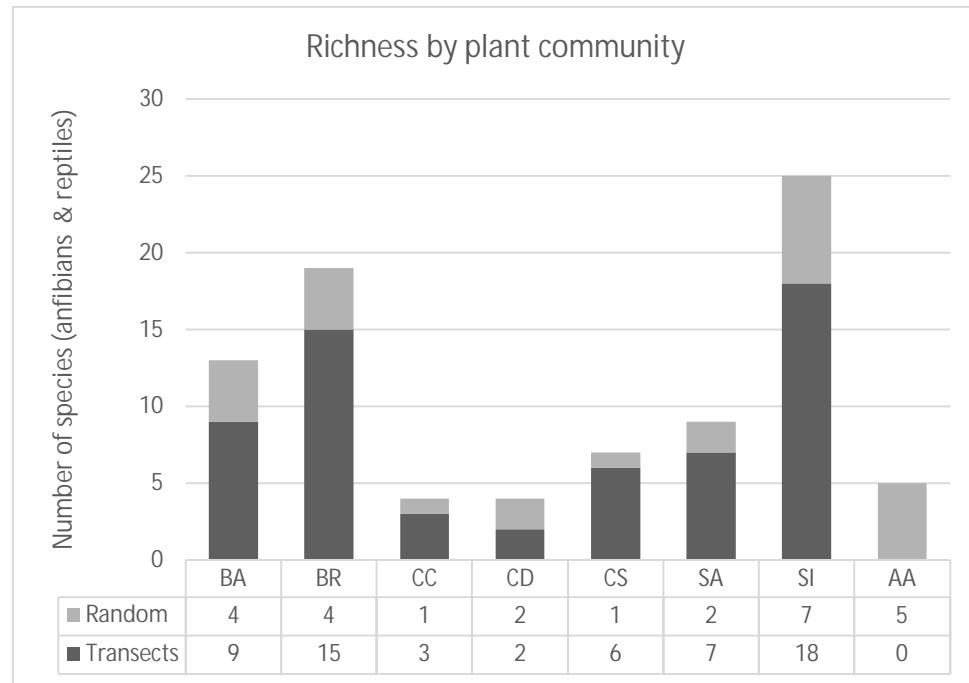

The amphibians recorded are all anurans (frogs and toads). The most numerous families in terms of species are Leptodactylidae (jumping land frogs) and Hylidae (tree frogs), both with 13 and 15 species each; followed by Bufonidae (toads) and Microhylidae (small-mouthed frogs). The most numerous genus was *Leptodactylus* (Leptodactylidae) with six species, followed by *Scinax* (Hylidae) with four species. The only family without representation that might be present is Odontophrynididae.

Reptiles, on the other hand, were represented by seven families, of which the most numerous was Dipsadidae (non-venomous snakes) with eight species, followed by lizards of the Tropiduridae family with four species. The rest were represented by only one or two species each, but from very diverse groups such as turtles, caimans, and both groups of venomous snake families: Elapidae (corals) and Viperidae (pit vipers and rattlesnakes). The most abundant group, with many individuals seen randomly throughout the entire campaign, was the Tropiduridae. *Teius teyou* was the most frequently seen species, with several individuals seen crossing paths during the main hours of activity.

The three communities with highest richness of herpetozoa were SI (25 species), BR (19 species) and BA (13 species). Amphibians contributed most of the species to these results with 22 species in SI, 14 species in BR, and 9 species in BA (see Figure 42).

Figure 60 – Figure 6–1 Number of species recorded under the various plant communities. Number of species found along transects and contribution from random surveys (by night, casual encounters)

Auditory records of 16 species using the SI as a breeding/mating ground were made based on vocalizations, which also resulted in the highest number of species vocalizing in any of the plant communities. In spite of this, surprisingly only five species of reptiles were observed at this site: two of the three most recorded lizards (*Teius teyou* and *Notomabuya frenata*) and two snakes with single records (*Oxyrhopus guibei* and *Philodryas olfersii*).

BR and BA follow the SI in terms of species richness; in these formations, several species of anurans carry out vital activities such as estivation, hibernation, foraging, shelter and dispersal, as well as reproductive activities in the case of certain species (Gibbons 2003). A clear example is *Rhinella scitula*, a species that completes its cycle within the BR, breeding/mating at the edges of streams (Caramaschi & Niemeyer 2003; Maragno & Souza 2011), or the case of the males of *Leptodactylus elenae* which were recorded vocalizing from within the forest. Out of all the species found, only *Adenomera diptyx*, *Leptodactylus bufonius* and *L. labyrinthicus* were inactive and found hiding/sheltered. In the case of BR and BA, six and five species of reptiles were found, respectively. In the BR we can mention the records of *Chelonoidis carbonaria* (tortoise), a sheltered *Bothrops diporus*, and a *Micrurus frontalis* which was found being preyed upon by a *Salvator merianae*; proof of the trophic interaction between herpetozoans. Furthermore, this particular event was interesting, as this lizard has been recorded preying upon multiple reptile and amphibian species (Kasperoviczus et al. 2015), but not this particular coral.

In the SI, the most frequently encountered species was *Leptodactylus fuscus* (representing 26% of the total number of individuals observed), a very common and abundant jumping/leaping land frog found near permanent or temporary bodies of water, and even in degraded and urban habitats (Cei 1980, Souza et al. 2014). Other

common species include *Leptodactylus podicipinus* (21%), *Physalaemus albonotatus* y *Pseudopaludicola amheghini* (8% each); the latter, although difficult to observe, calls/sings/vocalizes from low levels among herbaceous plants on flooded soils and was found in great abundance throughout the area. In the BR, the two most abundant species by a wide margin were *Pseudopaludicola ameghini* (26.3%) and *Physalaemus albonotatus* (23.1%), followed by *Leptodactylus fuscus* (15%) y *Rhinella scitula* (8%). These species were observed in great abundance in the understory, particularly juveniles, though were highly elusive among the leaf litter. Similar patterns were seen in the BR of the Humid Chaco (Moreno 2017), where *P. albonotatus* and *P. boliviana* dominate the diversity of terrestrial anurans, while *S. nasicus* dominates the diversity of arboreal anurans. The encounter rates within other plant communities were too low to make any statement regarding relative abundance. Nevertheless, it is worth mentioning that four individuals of *Melanophrynniscus fulvoguttatus* were observed (15%) in BA, making it the species (out of six) together with *P. albonotatus* with the highest number of encounters. Although observed in the forests, these small toads were detected calling/singing/vocalizing in tall herbaceous fields in the *Cerrado*, where temporary bodies of water form. In *Cerrado* phytophysionomies, *Teius teyou* was the most common, but with only four or fewer records for each formation.

The diversity indices were applied only to the amphibian records, since the reptile encounters were very fortuitous and from very distant taxonomic groups. Both Shannon and Simpson indices show the same pattern, where SI and BR are more diverse with respect to BA. It is also observed that the SA has insufficient records to adjust the estimates to calculate reliable estimators. This is consistent with the results described above. Of the amphibian species listed, none have any value in terms of commercial use and are therefore not listed in CITES. In terms of conservation status, only *Rhinella scitula* and *Dendropsophus elianae* are included under some degree of threat, both at international and national levels. *Rhinella scitula* is a small terrestrial toad (34 -51 mm) endemic to the *Cerrado*; in Paraguay it is found exclusively within the Departments of Amambay, Concepción and San Pedro (Brusquetti et al. 2006, Smith et al. 2012, Sugai et al. 2014). *Dendropsophus elianae* (20 - 26 mm) is an endemic climbing frog of the *Cerrado* (Napoli & Caramaschi, 2000); it has few records in the country which all come from within the Departments of Amambay and Concepción. Its restricted distribution and few records rank it as EN (endangered) at a national level (Motte et al. 2019). Of the reptile species recorded, none are included under any level of international threat category. At a national level, however, *Chelonoidis carbonaria* (red-footed tortoise) and *Caiman latirostris* (broad-nosed caiman) are threatened (MADES Res. N°206) and listed in CITES. Among the species with a high probability of occurrence, *Eunectes notaeus* (*anaconda amarilla*) and *Boa constrictor* (*boa de las vizcacheras*) are listed in CITES; the latter, together with *Norops meridionalis* (*camaleoncito*), are threatened at a national level. *Chelonoidis carbonaria* is a large land turtle, with a widespread but fragmented distribution in South America, whose southern portion covers most of the Pantanal biomes, the northern portion of the Chaco and southern portion of the *Cerrado*. The only record was made within the BR of the main course of the Trementina stream, an area almost unaffected by anthropic activities, though locals affirm that it is also seen in more modified areas.

At present, there are no legal commercial uses of reptiles in Paraguay (MADES – DGPCB 2019) though historically the local populations, immigrants and indigenous, have utilized wild species for subsistence, trade, pets, medicines and rituals (MADES –

DGPCB, 2019), including reptiles such as boas, aquatic and terrestrial turtles e.g. *Chelonidis carbonaria*, both species of caimans and tegu lizards (*Salvator*). In the 80s and 90s, there were national programs for caiman (Aquino & Scott, 2008), boas (Waller et al., 1995), and tegu lizards (Mieres & Fitzgerald, 2006) harvesting mainly focused on their hides. None of these programs are any more valid and the trade of these species is illegal.

Ornithological survey

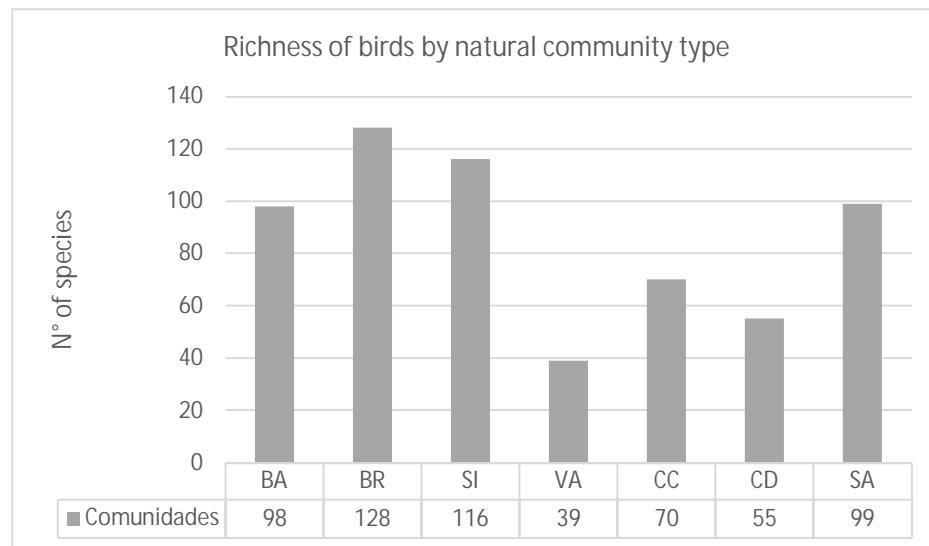

A total of 223 species of birds were recorded, belonging to 25 orders and 50 taxonomic families, including the Tyrannidae (13%), Thraupidae (11%) and Psittacidae (6%) families with most species recorded. Among the sampling areas Gavilán and Trementina presented highest number of species recorded during fieldwork (54% and 53%, respectively), while in Santa Teresa (50%) and Zapallo (49%) and San Liberato were the sites with the less recorded species (34%). The difference in number of species recorded between the highest and lowest sampling areas was due to the fact that the travel to and from the other sampling areas was made from Gavilán, thus creating a greater opportunity to record occasional species, and this impacted on the total richness of these sites in particular.

Figure 68 – Richness of birdlife by sampling area

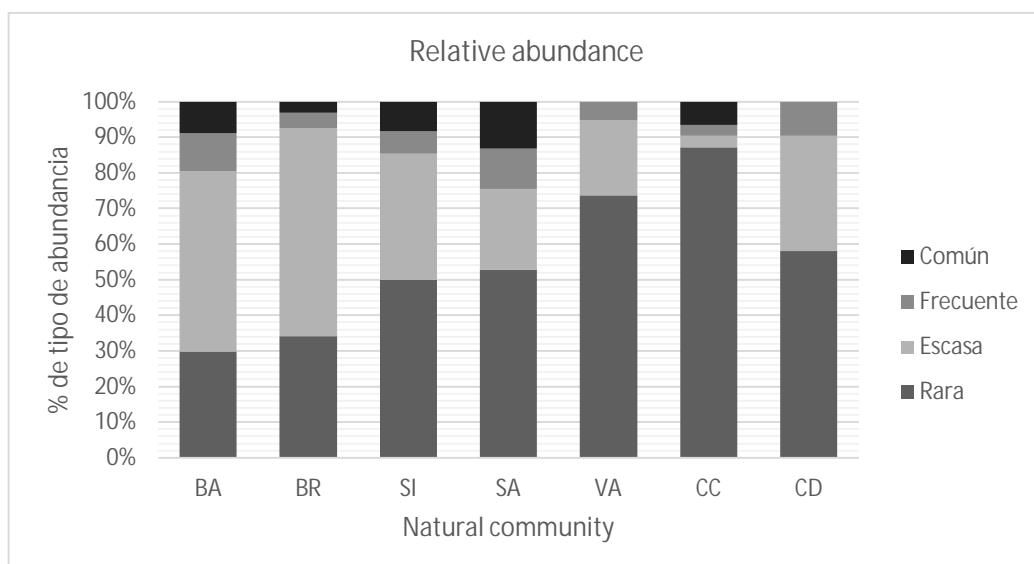

The natural community with the highest number of species was the BR (57%), bearing in mind it was the site with the highest number of lists among all the others and the one surveyed in all properties; followed by SI (52%), SA (44%) and BA (44.6%) with 52, 99 and 98 species recorded in each, respectively. The phytophysionomies of the *Cerrado*, *Campo Cerrado* (CC) and *Cerradón* (CD) were the sites with the lowest number of recorded species and were only identified in one property. The latter could be due to the fact that not all sites had typical plant formations of the *Cerrado* in a good state of conservation, and some of them were subject to fires during the monitoring, and were grazed by livestock. In the natural communities of the BR, CC and SI, species under one or another category of national and international threat were found. Meanwhile, the species with migratory patterns were recorded, for the most part, in the BR (50%) and SI (30%) formations; the remaining 20% were distributed among the other communities.

Figure 69 – Richness of birds by natural community type

With regard to the relative abundance evaluated within the 192 lists in all natural communities, a total of 3.180 individuals were recorded, with BR being the community with the most individuals counted (38%), followed by BA with 21%, SI (12%) and SA (10%). Meanwhile, the formations with the lowest number of individuals were VA (5%), CC (8%) and CD (6%), respectively, which could be due to the fact that they have fewer lists compared to the other sites. In all the communities, the relative abundance of the species was considered rare, because they were only detected once during all the patrols. The other large part was scarce with more than two records, and to a lesser extent frequent and common (between three and nine records), with BA, SA and CD being the sites with the most frequent species. Meanwhile, the SI was the site with the most common species (between 4 and 17 records), due to being detected on several occasions.

Figure 70 – Relative abundance of the recorded bird species

Six species were recorded that fall under categories of threat at an international level (NT and VU), while six species were recorded that fall under categories of threat at a national level (Threatened and Endangered) (MADES Resolution No. 254/19, Rojas et al. 2020, IUCN 2021). There were several records of a single endemic species to the *Cerrado*, *Saltatricula atricollis* (*pepitero de corbata*), at CC and SA in all sampling sites. In spite of being considered an endemic, this species is expanding to the south due to the savannization of landscapes in the eastern region of the country (see ornithological annex). Also, the record of *Alipiopsitta xanthops* (loro cara amarilla) another endemic species, recently documented for the country and with few records (Alvarez et al. 2012), are among the eleven species endemic to the Cerrado which occur in Paraguay according to Silva (1997).

Thirty-nine species (17%) of the birds recorded are included in the CITES Appendices. All species of Psittacidae Family are included in Appendix II together with some species of Accipitridae and Thraupidae. Two species (*Pteroglossus castanotis* and *Sarcoramphus papa*) are included in Appendix III and *Jabiru mycteria* in Appendix I. This report includes the 59% of the psittacid species of Paraguay. This region is habitat for most of the parrot species of the country, one of the bird families with most pressure regarding illegal capture and trafficking for the pet trade, resulting in drastically reduced populations. It is for this reason that this information should be considered relevant when implementing protection and conservation strategies within the project area. Among the species of importance for conservation, iAlipiopsitta xanhops, an endemic to the Cerrado and threatened with extinction at the local leveal and NT at global level; *Ara chloropterus*, one of the three species of Macaw that occur within our country, though this species is not threatened globally, it is considered Endangered at a national level (MADES Res. 254/19). This species is frequently observed and there are indications that it could be nesting within the area it was recorded, according to interviews carried out with the local population.

Information was gathered regarding *Anodorhynchus hyacinthinus* and *Ara ararauna*, two of the three species of macaw that occur in Paraguay. Both are considered Endangered at a national level; however, at an international level, the first species is ranked as Vulnerable (VU) while the latter species ranks under the category of Least Concern, according to the IUCN (2020). According to key informants, individuals of this species enter from Brazil to feed and descend towards the Serranía San Luis, which coincides with the frequent records from ranches near the northern edge of the Serranía San Luis National Park (Levatich & Padilla 2019, Rojas-Bonzi et al. 2020). The species was recorded nesting in some of the properties surrounding the park (Ea. Arrecife, Ea. Garay Kue as well as in San Luis de la Sierra (Rodríguez et al. 2019).

Species that have both, seasonal as well as regional migratory movements, were recorded and four states of occurrence were identified. Of the 192 species, 89% are BR, 8% are BN, 2% are BS and only *Tringa solitaria* is NM. Only one IB species (*Passer domesticus*) was recorded.

Table 16 – State of occurrence of the birds recorded in the area

State of occurrence		
BR	Breeding Resident	Permanent breeding resident
BN	Breeding Migrant to the North	Species that breeds in Paraguay, but is less abundant or absent during winter
BS	Breeding Migrant to the South	Species that breeds in Paraguay, but is more abundant or absent during winter
NM	Nearctic Migrant	Nests in North America during the northern summer and then migrates south during the southern spring and fall.
IB	Introduced	Introduced permanent breeding resident.

Source: Adapted from Guyra Paraguay (2004).

Another noteworthy species was *Pipile cumanensis*, which according to del Hoyo et al. (2019), has a distribution that ranges across the south of Venezuela, Guyana, northwestern Brazil and into the Amazon region of Colombia, Peru and Ecuador, thus leaving the subspecies *Pipile cumanensis grayi* as a species that occurs in Paraguay. In this sense, the IUCN follows the same nomenclature for its Red List but the change has not yet been accepted by the South American Classification Committee (SACC, Remsen et al. 2020). Consequently, it continues to remain as *P. cumanensis* for the country, but maintains the threat category assigned by the IUCN for *P. grayi*. It is also threatened with extinction (AE) at a national level. Records of this species in the country are distributed within the northeast of the Western region and in the departments of Amambay and Concepción. The other species of this family was *Crax fasciolata*, which is locally threatened with extinction (AE) and vulnerable (VU) at an international level. These species of the Cracidae family are more associated with BR, but can also occur in several forest communities of the *Cerrado* (BC) (MADES Resolution N°254/19, Rojas-Bonzi et al. 2020, IUCN 2021).

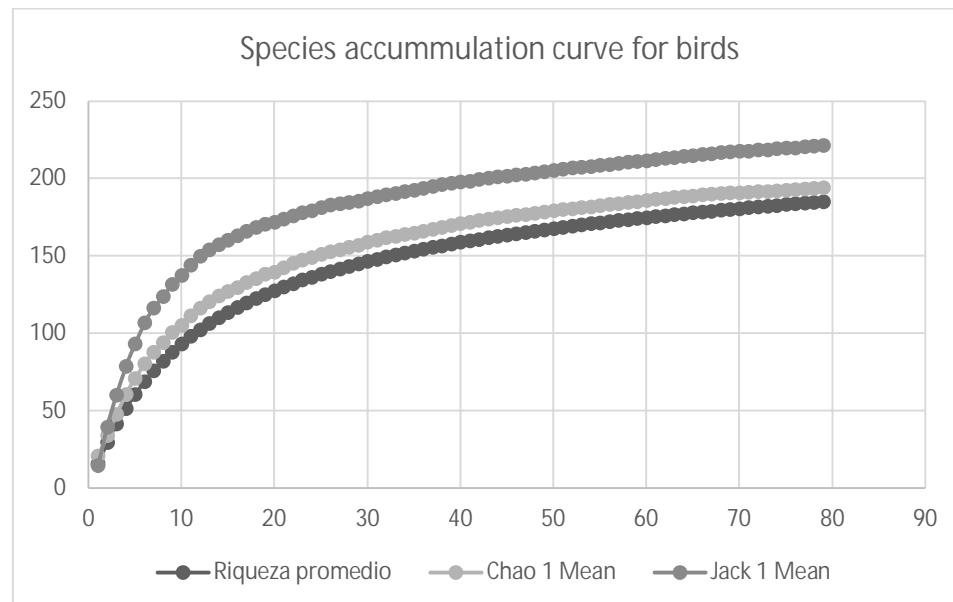

Among the birds registered during the first sampling campaign, the species indicated as "hunting for self-consumption" that were found in the forest formations (*Crax fasciolata*, *Pipile cumanensis*, *Crypturellus* spp. and *Patagioenas picazuro*) are listed. Meanwhile, in grassland environments tinamous (*Rhynchosciurus rufescens* and *Nothura maculosa*) are listed, and in natural aquatic communities, mainly ducks (*Cairina moschata*, *Dendrocygna viduata* and *Amazonetta brasiliensis*). According to the interviews carried out with the local inhabitants, their reports coincide with Morales and Zarza (2007), where they mention that subsistence hunting is widely extended in Paraguayan territory. Meanwhile, the parrots (parrots, macaws and parrots) are the main family affected by the illegal trafficking and trade of wildlife destined for pets in Paraguay (Mendoza et al. 2015). Morales and Zarza (2007) mention that there are other uses of birdlife due to their "medicinal or ornamental properties, but whose practice is exclusively limited to indigenous groups associated with forests. Among the species known for these uses were recorded, in this survey campaign: *Rhea americana* and birds of the families Tinamidae, Columbidae, Cathartidae, Corvidae and Turdidae.

Based on the sampling effort carried out in 18 days in the field that resulted in the registration of 223 species of birds, through 72 transects of 150 m, added the occasional

species, totaling the survey in 192 lists generated in the transects during the morning and the afternoon in the different natural communities, the accumulation curve indicates that the effort is representative, since the curve tends to be asymptotic. This indicates that the number of new species that could be registered in the area is decreasing, or, in other words, a large part of the species present in the selected sampling sites were registered.

The Chao 1 estimator indicates that nine more species could be added to the 185 recorded in the transects established in the different plant communities. On the other hand, the Jack 1 estimator indicates 221 expected species as the maximum number (Collwell 2009). This last number almost coincides with the total number of species recorded inside and outside the transects in all the sampling units evaluated during the first sampling campaign (223 species).

Figure 71 – Species accumulation curve for birds recorded in the field campaing in Paracel Properti

The Simpson index value was 0.984 (maximum value 1), which indicates a high probability that two individuals of different species are registered, therefore the sites sampled during campaign 1 present a high diversity, taking into account the sampling effort made.

The value of the Shannon-Wiener index obtained was 4.6, being the maximum value estimated for the sampling data of 5.2, which indicates that the species were uniformly represented, considering all the sampled species, which could indicate that the diversity of birds is high in the sites sampled during campaign 1.

Mammalian survey

A total of 37 mammal species were recorded, corresponding to 10 orders and 19 families. This represents 19% of the species, 100% of the orders and 50% of the families present in Paraguay; it also represents 35% of the species listed as possible. Furthermore, signs of at least three taxa found that could not be identified at species level, as well as two rodents were recorded on camera traps whose identification remains totaling at least five unidentified species. This indicates that 42 mammal species are recorded directly or indirectly during this survey.

A total of 34 species were recorded directly with the systematic sampling, included the species undetermined what represents 80% of the 42 taxa recorded. On the other hand, eight species were recorded indirectly, among them species elusive species such as *Ozotoceros bezoarticus* (Pampas Deer) and *Chrysocyon brachyurus* (Maned wolf), and species of importance for conservation such as *Panthera onca* (jaguar).

The species accumulation curve generated by sampling with camera traps and linear transects indicates that the survey tends towards an asymptote, but that the richness will continue to increase with greater sampling effort. Using only direct records, the Chao 1 richness estimator presents a mean value of 37.5 (95% CI: 34.6 - 52.8), while the Jackknife 1 estimator presents a mean value of 41.9. According to these estimators, during the survey between 80% (Jack 1) and 90% (Chao 1) of the species that could be recorded with the same sampling effort were recorded.

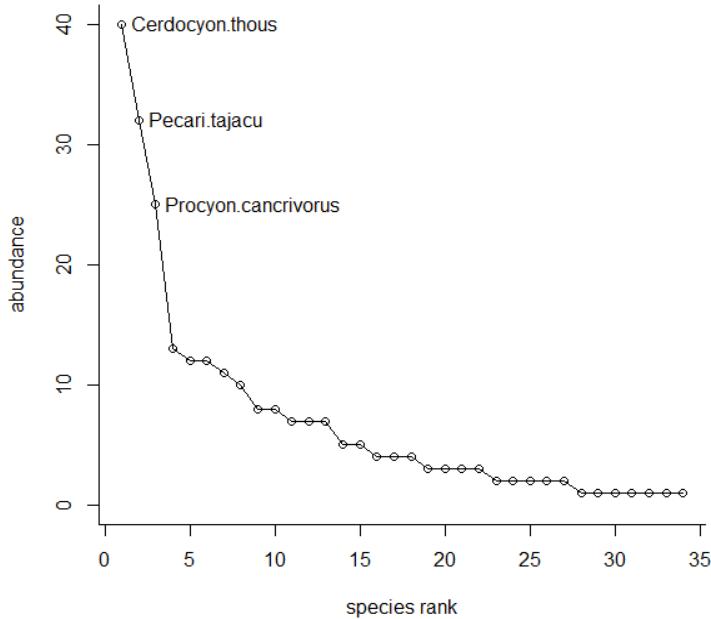

Figure 75 – Species accumulation curve for mammals and richness estimators per sampling unit

Of all the mammals recorded, the order Carnivora is the best represented with a total of five families and 13 species; the Felidae family has the most species (5). The order Rodentia is the second best represented, with a total of five families and six species recorded. Furthermore, 100% of the representatives of the families Myrmecophagidae, Leporidae, Procyonidae, Tapiridae, Dasyprotidae and Cuniculidae in Paraguay were recorded during this survey.

On the basis of direct records, *Cerdocyon thous* (*zorro de monte*) is the most abundant species observed, followed by *Pecari tajacu* (collared peccary) and *Procyon cancrivorus* (*osito lavador*). Other frequently occurring species include *Tapirus terrestris* (tapir), *Dasypus novemcinctus* (*mulita grande*), *Sylvilagus brasiliensis* (*conejito de monte*) and *Hydrochoerus hydrochaeris* (capybara). Records of deer (*Mazama gouazoubira* and *M. americana*) are also quite frequent; however, most of the tracks are not attributable to any one of the two species (Angeli et al. 2014) due to the variability in size of the individuals, making it difficult to determine their specific abundance. On the other hand, *Desmodus rotundus* and *Platyrrhinus lineatus* (bats), *Cavia aperea* (cuis), *Sapajus cay* (capuchin monkey), *Leopardus braccatus* (pantanal cat), *Leopardus pardalis* (ocelot) and *Coendou prehensilis* (large porcupine) were the species with the least direct records made.

Figure 76 – Rank-abundance curve for the mammal community recorded during sampling

The observed species richness varied according to the sampling areas and the natural communities sampled. Among the AM, Gavilán is the one with the highest species richness with 70% of the registered species. On the other hand, among the natural communities, the BR is the one with the greatest wealth observed with a considerable difference with the wealth observed in other natural communities. It is worth mentioning that the CS community was not included in the figure because there were no traces attributable to any species; however, trails and burrows were observed in this community.

Figure 77 – Observed richness by sampling area (AM) and natural community

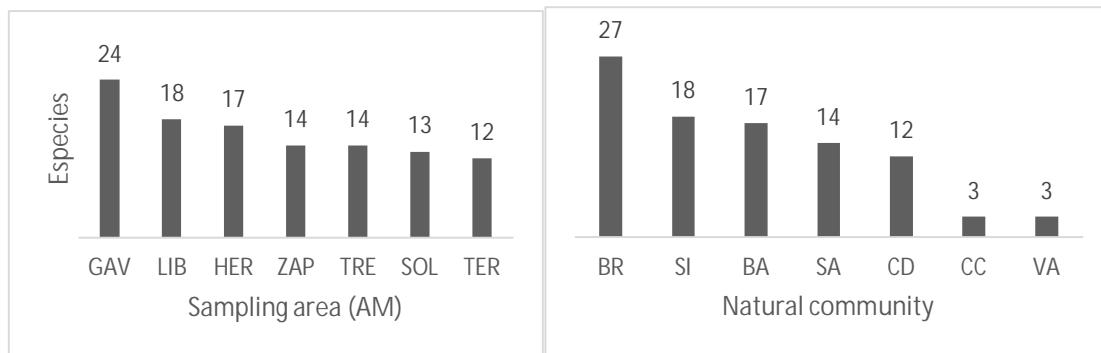

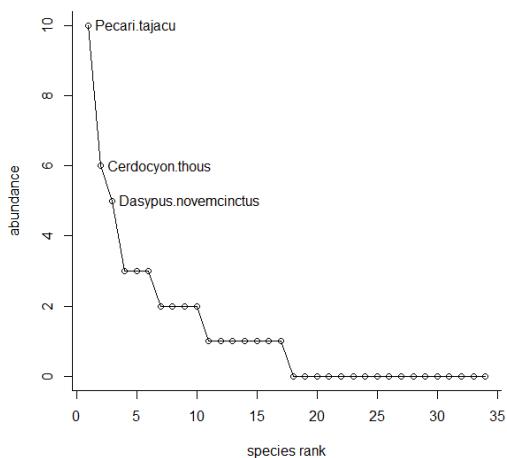

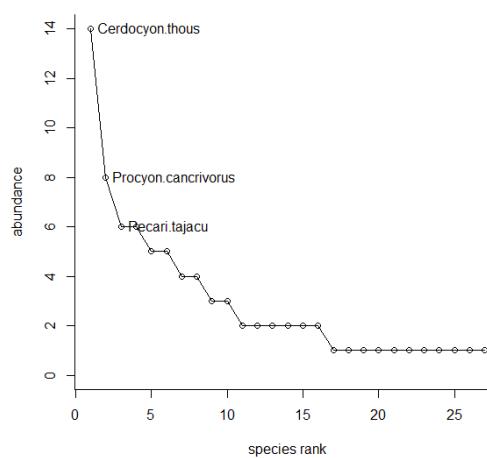

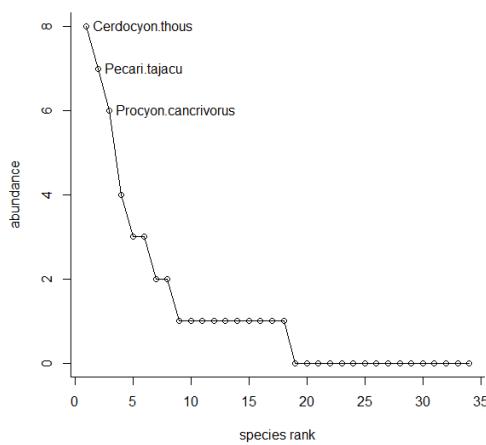

Figure 78 – Rank-abundance curves for mammals per plant community

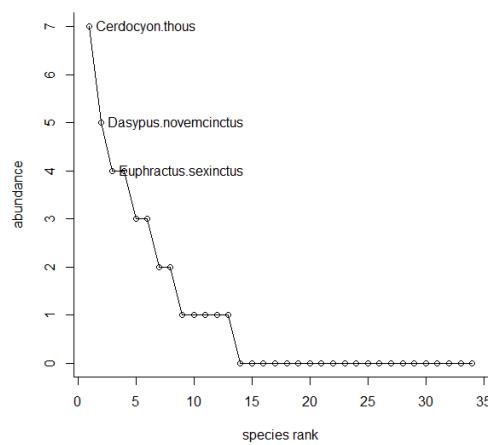

BOSQUE ALTO (BA)

BOSQUE RIBEREÑO (BR)

SABANA INUNDABLE (SI)

SABANA ALTA (SA)

The structure of the mammalian communities presented variations in the different plant communities. In Figure above it is observed that the crab-eating fox is the dominant species in terms of abundance in three of the four analyzed plant communities (BR, SI and SA), while the collared peccary is the dominant species in the BA formation, in the one with the fox in second place. It should be noted that two armadillos presented high abundances in the SA community.

Table 18 – Shannon and Simpon Indexes for mammals per plant community

Indicator (mean)	Plant community				
	All	BA	BR	SA	SI
Taxa/Richness (S)	34	17	27	14	18
Individuals	243	44	83	37	46
Simpson (1-D)	0.926	0.897	0.93	0.88	0.898
Shannon (H)	2.99	2.54	2.93	2.38	2.55

According to the estimated values of the Shannon (H) and Simpson (1-D) indexes for the different plant communities, the uncertainty in predicting a species taken at random in the sample is measured, so it increases as it increases. The representativeness of the species in the sample, that is, it increases with diversity (Magurran, 2004). The Simpson index (D) is a measure of the dominance that a few species present in the analyzed community, that is, the calculated value decreases as diversity increases; For this reason, it is intuitive to use the complement of this index, or the Simpson diversity index (1-D), which is a measure of the degree of equity between the species present in the community (Magurran, 2004). According to the values calculated here, the plant community with the greatest diversity of mammals is the BR.

Regarding species of importance for conservation and of scientific interest, we can highlight the records of *Panthera onca* (jaguar), Near Threatened (NT) internationally and Critically Endangered (CR) in Paraguay, as well as *Chrysocyon brachyurus* (maned wolf), NT under the IUCN and Vulnerable (VU) at the national level. Both species have been recorded indirectly based on the reliable testimonies from local people. Other records of interest include *Leopardus braccatus* (*gato del pajonal*), NT under the IUCN and Data Deficient (DD) at a national level; *Leopardus pardalis* (ocelot), NT in Paraguay; and *Myrmecophaga tridactyla* (giant anteater), *Tapirus terrestris* (tapir) and *Tayassu pecari* (white-lipped peccary), these last three being VU both at national and international levels. Among all the species recorded, eight fall under some category of national or international threat, two are considered DD (lacking data for evaluation) at the international level and one at the national level, while one species (*Sylvilagus brasiliensis*) is not evaluated due to recent changes in its taxonomy. Furthermore, 18 of the recorded species are found in one or another of the CITES appendices.

Species of high conservation interest

Among the registered ones, six of special interest for conservation are identified. Ecological aspects are briefly described following Parera (2017) and Canevari y Vaccaro (2007), their current conservation situations and main features (IUCN 2021; APM and SEAM 2017).

Panthera onca or jaguar

Is the biggest cat in the American continent, with solitary habits and mostly nocturnal, he could also be active on a daily basis. Very territorial (make marks on the trunks of trees and deposits to mark their territory). Action range between 10 and more than 300 km², depending on the availability of resources. They inhabit a wide variety of environments between dry and humid forests, pastures, savannas, etc. Predators in the top of the terrestrial trophic red in the neotropics. Tusks: peccaries, carpinchos, pieces, agutíes, armadillos, tapirs, monos, corzuelas, garzas, cigüeñas, peacocks, other carnivorous animals such as ocelotes or pigs, and even domestic animals such as birds and cattle. Their reproduction could take place over the year, in Paraguay it is the most frequent that births occur between November and January. (gestation between 90 and 110 days, layer from 1 to 4 individuals). The care of children is carried out exclusively by the child, the lactation lasts for one semester and the children remain with the mother for 2 years. The population trend of this species is decreasing and the historical distribution of the species has been reduced in different parts giving rise to local extinctions. In the country its main threats are the loss of habitat due to the change in the use of sweat, the cacería and the conflicts with humans due to the predation of cattle.

Leopardus pardalis or ocelot

Medium spotted feline in compact body, cut glue and robust edges. It is fundamentally nocturnal, even in areas without anthropic alteration it also becomes active during the day. It lives in environments with good vegetation cover (wet or dry forests), in the bush steppes. Its area of action is variable depending on the type of environment; the heights could cover an area of 11 km², but males were up to 18 km². It feeds on smaller mammals, birds, amphibious reptiles and even pecces, among its prey we can mention the agutíes, gossips, conejos, lizards and small turtles. In the present reproductive season, it generally has 1 or 2 offspring per layer. Declining population trend in the country is found in the category of Amenazada Casi. Main hazards: loss of habitat and furtive caza for the commercialization of their skin.

Chrysocyon brachyurus or maned wolf

It is the largest size in South America, with very large black legs, the rest of the red skin and a crin over the body and the men. It is basically night and twilight, very rare to see during the day. From solitary habits I could also live in pairs. The range of actions is approximately 30 km². Its diet is omnivorous, and it feeds mainly on small rodents, fruits and insects, it also feeds on birds, trappings, reptiles, amphibians, pieces and cangrejos. Reproduction takes place once a year between April and June. The gestation lasts for a few months and the layer has between 1 and 5 children. An unknown population trend on an international scale, however, in Paraguay its population has declined by less than 30% as a result of the loss and habitat degradation. Threats: trampling, hunting by conflicts with humans due to predation of coral birds, diseases acquired by contact with domestic species.

Myrmecophaga tridactyla or giant anteater

Edentate of long horn and tongue, with a hard and wide coat, with a characteristic coloring with a black base and a white line that crosses over the flanks up to the back.

With solitary and cavernous habits, it is found mainly in open areas such as pastures and wooded savannas, which also inhabit dry and humid forests. Its area of action varies between 3 to 9 km² and feeds exclusively on termites. Its reproduction could take place over the year. The gestation period lasts a little more than 6 months, since each child has a sole. The lactancia lasts around 7 months. Decreasing population trend in Paraguay is estimated to decrease its population size by 30%. Amenazas: loss of habitat, fires, traffic in races and illegal caza.

Tapirus terrestris or tapir

The South American land mammal of larger size. Considered an ingeniero of the ecosystem that modifies the environments that it inhabits opening roads between the vegetation. It inhabits tropical and subtropical jungles, jungles in galleries and chaqueños forests. It is generally solitary and mainly nocturnal, which can also be active during the day. Its area of action ranges from 40 to 65 km², and several individuals can share the same area. Its reproductive age is apparently related to the rains. Gestation lasts between 13 to 14 months, luego de la cual nace a sola cría. Decreasing population trend, a very important decrease in population size was observed in the country, especially in the Eastern Region, where it is estimated that the decrease was 90%. Amenazas: lost and degradation of their habitat, the furtive cacería and the caza for consumption, as well as the great works of large sizes.

Tayassu pecari or White-lipped peccary

The color is the darkest character and is characterized by having the white mind, which gives it the common name in Spanish. It is gregarious, forming large piaras or groups of numerous individuals whose size can vary from 15 to hundreds of individuals. It inhabits tropical and subtropical jungles, dry forests and wetlands and savannas. They are nomads, spread over a wide territory according to the availability of resources. It feeds on fruits, seeds, flowers, leaves, roots, fungi, frogs, ranas, ophidians, and even small mammals. The births can take place all year round, the gestation lasts between 5 to 6 months, from 1 to 4 children (often 2). The population trend is decreasing, and in the country the data suggest an important breakdown on both sides of the Paraguay River. Amenazas: lost and degradation of the habitat, the furtive and consumption cacería, and the advance of the human frontier over wild cacería areas.

The following are pictures of some species recorded by camera traps.

6.1.4.2 Primary Data – Dry Season

The primary data for the dry season is presented together with the primary data for the rainy season, which are described in the CSI final report (**ANNEX I**).

Ichthyological survey

The 81 species that make up the ichthyofauna surveyed represent 26% of the ichthyofauna in Paraguay, according to the Koerber, Vera & Reis (2017) checklist. In total, 27 Families distributed in 7 Orders were registered, being the Order CHARACIFORMES with 10 Families the one with the greatest richness, within which Characidae (Mojarras) is the Family with the highest number of species recorded (23 species).

During the rainy season survey, 64 species were found, the most abundant species was Odontostilbe pequira (Mojarrita). In the campaign corresponding to the dry season, 62 species were identified, of which 17 were new, the most abundant species was Corydoras aeneus, this species had great dominance in several AMs, in this campaign two new groups were recorded, corresponding to the Order of MYLIOBATIFORMES, which are the freshwater stingrays and SYNBRANCHIFORMES, commonly called “eels”.

Herpetological survey

In both campaign, rainy and dry season, a total of 59 species (33 amphibians and 26 reptiles) were recorded and this represents 13 families (4 of amphibians and 9 of reptiles).

During the rainy season, a total of 31 species (24 amphibians and 7 reptiles) were recorded along the transects, while another nine amphibians and 14 reptile species were recorded during random searches and at breeding grounds in the entire study area.

In the dry season, 24 species (16 of amphibians and 8 of reptiles) were recorded in the transects, plus 3 species of amphibians and 6 of reptiles in occasional sightings, for a total of 31 species (19 of amphibians and 12 of reptiles). Representing a lower number of species found compared to the rainy season, where 14 species of amphibians and 9 more reptiles were recorded.

No new species of amphibian was recorded, but two species of snakes were added to the general list, these are Palusophis bifossatus and Erythrolamprus typhlus and three lizards, Tropidurus torquatus, Stenocercus caducus and Colobosaura modesta.

Ornithological survey

A total of 260 species of birds were recorded, belonging to 26 orders and 50 taxonomic families, including the Tyrannidae (15%), Thraupidae (11%), Furnariidae and Psittacidae (6%) families with most species recorded. The dominant species of the first most abundant family varied during the wet and dry seasons, being the most common during the first season: *Tyrannus melancholicus*, *Megarynchus pitangua*, *Myiarchus tyrannulus* and *Empidonax aurantioatriocristatus*, which by the shape of the beak hunt larger insects in flight , unlike the drier season, where the availability of various flying invertebrates is reduced, in addition, these birds carry out regional migrations, therefore, they are replaced by other residents and / or migrants from the south, registered in the winter campaign, which were: *Xolmis velata*, *Xolmis irupero*, *Xolmis cinereus*, *Hymenops perspicillatus*, *Myiarchus ferox*, among the most common. The increase in the number of registered species of the Trochilidae family stands out, compared to the summer campaign in the wet season, which, according to Oliveira and Marquis (2002),

is probably a general phenomenon during the dry season since these species make a movement local towards gallery forests. In some cases, towards specific and fundamental plants in their habitats that bloom only for very limited periods and provide much-needed resources this season. The same authors mention that 90% of fruits available in the forest for consumption in forests and cerrados is due to parrots such as *Amazona* spp. and *Ara* spp., species that after eating part of these fruits, let them drop and are later consumed and dispersed by other birds or small mammals.

Mammalian survey

A total of 63 mammal species were recorded, 38 corresponding to 10 orders and 20 families in a first instance and later with a special effort focused on bats, 25 species were added. This represents 31% of the species, 100% of the orders and 50% of the families present in Paraguay; it also represents 35% of the species listed as possible. Furthermore, signs of at least three taxa found that could not be identified at species level, as well as two rodents were recorded on camera traps whose identification remains totaling at least five unidentified species.

This indicates that 42 mammal species are recorded directly or indirectly during this survey. The following analysis is referred to the general surveys of mammals developed in first instance and followed by a deeper based on the survey and findings of bat monitoring.

A total of 35 species were recorded directly with the systematic sampling, included the species undetermined what represents 83% of the 43 taxa recorded. On the other hand, eight species were recorded indirectly, among them species elusive species such as *Ozotoceros bezoarticus* (Pampas Deer) and *Chrysocyon brachyurus* (Maned wolf), and species of importance for conservation such as *Panthera onca* (jaguar).

6.1.5 Environmental DNA (eDNA) Analysis

According to Thomsen et al, the continuous decline in Earth's biodiversity represents a major crisis and challenge for the 21st century, and there is international political agreement to slow down or halt this decline. The challenge is in large part impeded by the lack of knowledge on the state and distribution of biodiversity – especially since the majority of species on Earth are un-described by science. All conservation efforts to save biodiversity essentially depend on the monitoring of species and populations to obtain reliable distribution patterns and population size estimates. Such monitoring has traditionally relied on physical identification of species by visual surveys and counting of individuals.

However, traditional monitoring techniques remain problematic due to difficulties associated with correct identification of cryptic species or juvenile life stages, a continuous decline in taxonomic expertise, non-standardized sampling, and the invasive nature of some survey techniques. Hence, there is urgent need for alternative and efficient techniques for large-scale biodiversity monitoring.

Environmental DNA (eDNA) – defined as: genetic material obtained directly from environmental samples (soil, sediment, water, etc.) without any obvious signs of biological source material – is an efficient, non-invasive and easy-to-standardize sampling approach. Coupled with sensitive, cost-efficient and ever-advancing DNA sequencing technology, it may be an appropriate candidate for the challenge of biodiversity monitoring.

Environmental DNA (eDNA) – defined as: genetic material obtained directly from environmental samples (soil, sediment, water, etc.) without any obvious signs of biological source material – is an efficient, non-invasive and easy-to-standardize sampling approach. Coupled with sensitive, cost-efficient and ever-advancing DNA sequencing technology, it may be an appropriate candidate for the challenge of biodiversity monitoring.

Results from eDNA approaches have provided valuable insights to the study of ancient environments and proven useful for monitoring contemporary biodiversity in terrestrial and aquatic ecosystems in large areas.

It was considered 115 samples in PARACEL forest lands. The following picture presents the monitoring points.

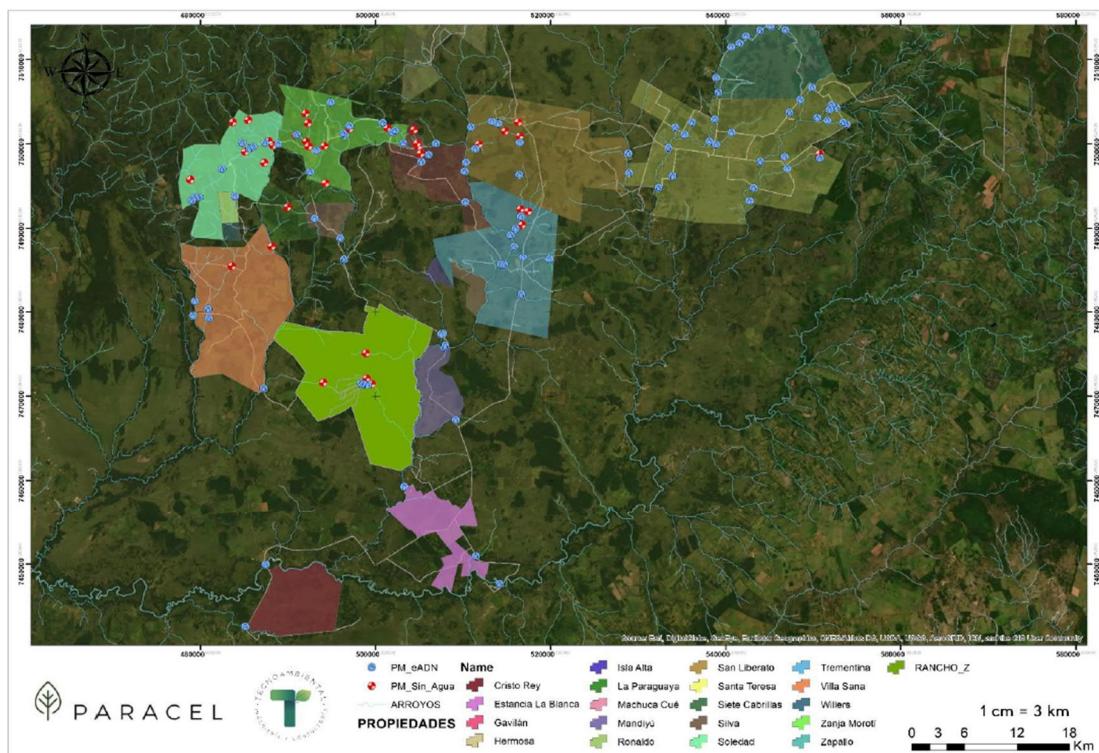

Figure 85 – Monitoring Points

NatureMetrics (2021)² has presented the result of the analysis of 115 samples collected. These samples showed evidence for 357 taxa with an average taxonomic richness of 39.9 (4 to 90) with the most abundant sequence for *Pimelodella* sp., and the most commonly detected species being *Hoplias* sp.

A total of 357 taxa were detected. 39.5% (141 taxa) were at least 99% similar to species in the global reference databases, and species names are suggested for these taxa. The remaining taxa were identified to the lowest possible taxonomic level: 40% to genus (143 taxa), 9.8% to family (35 taxa), and the remainder to order (38 taxa). The taxa belong to 5 classes, 38 orders, 90 families, and 188 genera. The taxon count per class was: 195 fish, 30 amphibians, 78 birds, 50 mammals, and 4 reptiles. Note that taxa are

² NatureMetrics. 2021. Vertebrate Metabarcoding Results. Paracel S.A., 12 pp.

approximately equivalent to species but some over-and under-estimation of diversity in some lineages is possible.

Species of note included eight species categorised on the IUCN Red List: turquoise-fronted Amazon (NT, *Amazona aestiva*), greater rhea (NT, *Rhea americana*), Neotropical otter (NT, *Lontra longicaudis*), Chacoan naked-tailed armadillo (NT, *Cabassous chacoensis*), and black-and-gold howler monkey (NT, *Alouatta caraya*), White-lipped peccary (VU, *Tayassu pecari*), South American tapir (VU, *Tapirus terrestris*), and Giant anteater (VU, *Myrmecophaga tridactyla*). These were generally limited to a small number of samples, except the Neotropical otter, South American tapir, and Giant Anteater which were found in 11, 10, and 8 of 14 Properties respectively. The number of threatened species detections per sample varied from 0 (51 samples) to 5 (1 sample).

The average species richness was 39.9 and ranged from 4 (HE-HU09) to 90 (CR-AQU07). A three-barbeled catfish species (*Pimelodella sp.*), which accounted for 7.34% of the total sequence reads, was among the most abundant in terms of sequences. Among the most commonly detected species were a trahiras fish species (*Hoplias sp.*), a characid fish species (*Characidae sp.*), and a pike cichlid (*Crenicichla lepidota*), which were detected in 101, 98, and 92 of the samples, respectively.

The complete report of NatureMetrics with the eDNA analysis and the results are presented in **ANNEX II**.

6.1.6 Discussion – Flora, Fauna and eDNA

Overall, the findings of this study exceed the expectations in terms of creating a biodiversity baseline for both flora and fauna carried out over the 29.5 of effective field work both in flora and fauna monitoring. These monitoring days resulted in an investment of 4.21 days per sampling area for both seasons. The evidence given by the complementary species shows the rich biodiversity for the study area.

A total of 700 plant species, belonging to 97 botanical families were recorded: 22 pteridophytes, 139 monocots, 539 dicots. The study made it possible to survey and classify the plant formations of one of the most threatened and less known ecoregions at a country level, despite its importance at a regional and global level. The current knowledge of its biodiversity is based mainly on floristic studies dating back more than 100 years. The most recent studies were carried out within the last three decades, and were mainly based on the application of the REA methodology in preparation for the Technical Justifications and draft Management Plans for Protected Areas. There are also a few floristic studies of specific taxa that have been carried out by local and foreign specialists.

Despite the fact that the Cerrado formations in Paraguay occur as isolated mosaics within various ecoregions -such as Alto Paraná, Amambay and principally the Aquidabán (MADES 2013) in the Eastern Region of the country, as well as the Cerrado ecoregion in the Western Region- many typical species are common among them, although some are exclusive. Regarding the floristic diversity of the formations corresponding to the Cerrado phytophysionomies represented by the Cerradón, Campo Cerrado and Campo Sucio, in a comparative study carried out with 411 of the 700 species registered for the study area (which includes those identified by genus and morphospecies), it was found that there is a floristic affinity of 30-57% between these

and the phytofisionomies of the Cerrado present in the departments of Canindeyu and Concepción. It was compared with the studies carried out by Peña-Chocarro et al. (2010), in the Mbaracayú Forest Nature Reserve, SEAM/UNDP/GEF (2006) in the Paso Bravo National Park, and Rojas Bonzi et al. (2020) in the Serranía San Luis National Park, when analyzing only those identified up to the species level of the 282 species recorded within the PARACEL project area (December 2021 campaign), we can confirm that the majority of them are in common. There are 162 species (57%) in common with the Mbaracayú Forest Nature Reserve, 127 species (45%) in common with the Paso Bravo National Park, and 85 species (30%) in common with the Serranía San Luis National Park. The complete list of analyzed/determined species is included in the Vegetation and Flora.

The formations of savannas and especially those that are linked to water (periodically flooded, flooded or with permanent water), are dynamic ecosystems, whose species - mostly annual, biannual or perennial herbaceous - are adapted to fluctuations in water and other environmental factors that determine the presence or absence of species in different seasons. Due to their floristic diversity and the presence of water, these sites are places of passage and feeding for the local fauna, which contributes to the pollination and dispersal of plant species.

In the flooded savannas, which generally develop in the lower portions of the land, it is possible to find variants with water (marshes, swamps, bodies of water) and without water (dry savannas), disparities that would also influence the richness of species found. The presence of "Islets" in this formation adds a floristic diversity, mainly woody ones, which play a very important role for the local fauna, such as provision of perch, nesting and feeding place, refuge, etc. In the main matrix, these islands generally occupy the highest parts of the terrain. For more information on this matter please see The islets of forests.

Mereles (2007) affirms forests are formations that exceed 5 m in height. In their vertical structure, they can have 3-4 strata of vegetation, reaching the primary layer or higher at a maximum height of 25 m. In most of them, the height of the trees in the first canopy no longer exceeds 15-18 m. In its horizontal structure there are several forms of life, such as: various herbaceous, shrubs, vines, epiphytes and trees; according to the geographic location where they are. In the case of the forest remnants studied, the riparian or marginal forest was the one that presented the greatest floristic diversity, compared to the high degraded forest, probably due to the degradation (extraction of timber) observed in the latter, in addition to the greater applied sampling intensity. In the Riparian or Marginal Forest, apart from the typical species of this formation, floristic elements belonging to the Cerrado phytophysionomy were recorded.

The fact that, although the study area is located at the extreme northwestern distribution of the Alto Parana Atlantic Forest (BAAPA), more than 40% of the tree species registered in the forest formations, High Forest and Riparian Forest, are common to the BAAP (Spichiger et al. 1992). On the other hand, it is important to point out that some species such as *Amburana cearensis* (clover), *Myroxylon peruiferum* (red incense) and *Syagrus oleracea* (guaviroba), are typical of the Cerrado Ecoregion, with a restricted distribution in the country.

Although there are recent studies and literature that make reference to the presence of several endemisms (Pena-Chocarro & De Egea 2018), as well as important plant genetic resources (De Egea et al. 2018) for food and agriculture -aspects of great

importance and relevance worldwide- a more detailed analysis is required for a better assessment of the floristic resources present in the study area based on the high potential they represent; this, however, is beyond the objective and scope of this biodiversity baseline.

Among the four taxa evaluated, 438 species of vertebrates were recorded (81 fish, 59 amphibians & reptiles, 260 birds and 38 mammals), corresponding to 110 taxonomic families with some additional species of invertebrates. The collected species information of fauna presents all the necessary evidence for their confirmation within the site, thus making an innovative contribution towards the knowledge of this transitional area between the Cerrado and the Humid Chaco and Atlantic Forest.

With regard to the ichthyofauna within the study area, we can mention the records of an additional 13 species of fish to the number already documented for the Aquidabán River (Insaurralde et al. 2012). Nevertheless, these lists share three species (*Charax leticiae*, *Moenkhausia dichroura* and *Pyrrhulina australis*) between both places. The diversity of herpetofauna is considered to be high, and the use of transects for the active search of amphibians & reptiles is one of the most useful and feasible methods for rapid assessments and to get a get an idea of the composition of an area.

Regarding the threatened species, the anurans *Rhinella scitula* and *Dendropsophus elianae* are endemic species to the Cerrado, which also have their general distributional limits within the country. On the other hand, the reptiles *Chelonoidis carbonaria* and *Caiman latirostris* present other conservation challenges. These latter four species -two frogs, one tortoise and one caiman- could be the indicator species for the herpetofauna of the site.

Of the 460 documented species of birds (historical and recent records) for the Concepción Department (eBird 2020), 260 species (56.4%) were recorded during the best time of year for birdwatching, coinciding with the end of the breeding season for Neotropical birds (Hayes 2014) and for this most of the species were found active and also austral nesting migratory birds which initiate their migration to the north at the end of the summer in the Southern Hemisphere (Guyra Paraguay 2004). We had expected to find more endemic species cited for the *Cerrado* in Paraguay (Silva 1997), though endemic species of other ecological regions were recorded such as those of the BAAPA and the Dry Chaco. Similarly, it was expected to record other species associated with plant formations and natural communities typical of this ecoregion, such as seedeaters (*Sporophila* spp.) and other birds associated with natural grasslands and savannas, as well as other species of Macaw that could inhabit the area. This absence could respond to the modification of native grasslands habitats for productive activities (areas in which the woody vegetation - shrubs and coco palms, is removed, implanted forests, etc.) which could affect the availability of proper habits for these particular species. Despite this situation, several individuals of *Rhea americana* were recorded in all sampled sites within diverse habitats with natural grasslands or sabanoid-like environments ; this species conservation status is NT globally, as well as other species which are dependent of open areas such as Seriema cristata, *Nothura maculosa*, *Rynchotus rufescens*, and those of floodable or humid savannas such as *Emberizoides* spp. and particular seedeaters occurring in these Cerrado formations as the savannas of tall grasses, among them *Sporophila plumbea*, recorded in the dry season monitoring.

Nevertheless, it is worth mentioning that other species of interest that occur in the *Cerrado* were also found, which fall under different levels of national and international

conservation status, in addition to the species that use this area as a stopover within their regional migratory routes, as well as other lesser known and under-recorded species in the region that use the habitats available at the site to complete their biological cycles. These are potential indicator species of the environmental quality and current condition of the study area. Among these species of interest, we can mention the Red Macaw (*Ara chloroptera*) which stands out as the flagship species of the *Cerrado* and in danger of extinction at a national level, given that this ecoregion is one of the last relics with the presence of a free population. Fifty-nine percent of the country's parrot species were recorded in the area and this entire order is included in Appendix II of CITES; they deserve certain protection actions related to trade, in order to avoid the reduction of their free populations. This is the family with the highest number of species of conservation concerns both at global and local levels; among them *Alipiopsitta xanthops*, endemic to the *Cerrado*, Endangered and NT. Both Psittacidae may be considered flagship species for the study area. *Crax fasciolata* and *Pipile cumanensis* are other species of interest, since the presence and abundance of both could indicate the quality of their habitat (mature forests and riparian forests), as well as help to evaluate their conservation status (Laíno et al. 2018). *Crax fasciolata* is threatened with extinction at a local level and Vulnerable at an international level, meanwhile *Pipile cumanensis* is Near Threatened at an international level, mainly due to habitat loss, unregulated hunting, and to a lesser extent, captured as pets. There are few studies of these species in Paraguay; consequently, their monitoring could be key to the design of strategies for their conservation.

We can highlight the findings for the order Carnivora, with the highest level of representation, and the Felidae family in particular with the observation of five of the eight species of felines in Paraguay. This phenomenon could reflect that the carnivore community, and therefore its prey, are in good condition; however, more profound studies should be carried out to better understand their conservation status.

All the species recorded during this campaign were "expected" for the area, with the exception of *L. braccatus*, whose record comes as a surprise considering the known distribution of the species (Nascimento et al. 2020), which reveals how poorly studied the mammalian fauna is in the region. The observed richness at each of the different localities does not necessarily reflect their true richness; for example, in the case of San Liberato and Hermosa with little sampling effort, we found a high species richness, what indicates these areas are very used by mammals. Something similar happens with the various natural communities, where the observed richness does not necessarily reflect the actual richness of these communities. This is due to the fact that the collection of data has different levels of effectiveness for the various communities and the sampling effort was not equal in all the communities explored. In rocky soils and grasslands for example, the likelihood of species detection by signs and prints was low, most of the records found in these sites were burrows in termite-hills (*takuruí*), feaces or prints in clearings where mud was present. One common problem was the permanent presence of livestock prints prohibiting this to detect mammals' trails. Species with few records (sightings), such as the cui (apereá), the porcupine, the bats and the capuchin monkey, do not reflect the true abundance of these species since they are difficult to detect due to their habits, as well as the type of sampling implemented. On the other hand, it is highly likely that the pantanal cat has a very low abundance, taking into consideration that its "rarity" and elusive nature are widely known (Pereira & Aprile 2012).

From the data obtained and the corresponding analyzes, it can be concluded that the mammal community is widely dominated, in terms of abundance, by the crab-eating fox (*Cerdocyon thous*) in all the analyzed plant formations, with a co-dominance with the collared peccary (*Pecari tajacu*), and crab-eating racoon (*Procyon cancrivorus*) when it comes to plant formations associated with water. In forested areas, however, higher species richness and an almost exclusive presence of felines and primates were regularly found. In open areas (savannas and implanted pastures), the mammal community was also dominated by the bush fox; however, it was found that these areas are widely used by armadillos (*Euphractus sexcinctus*, *Dasyurus novemcinctus* and *Cabassus unicinctus*) and anteaters (*Myrmecophaga tridactyla* and *Tamandua tetradactyla*). These species especially take advantage of the almost ubiquitous presence of the takuru in open areas. In the case of anteaters, they use open areas mainly for feeding; but, on the other hand, armadillos also use these areas to make burrows, which can be found in abundance both in implanted pastures and in high and flooded savannas. Other mammals also use open areas, such as deer, peccaries, and felines. However, in the case of felines (puma, ocelot, jaguarundi, etc.), all the records were obtained near waterways or forests with seasonal lagoons, which allows us to establish the hypothesis that they would have a marked preference through wooded and open areas near riparian forests or tall forests.

Among the species mentioned by the people interviewed, we can mention the jaguar (*Panthera onca*), the maned wolf (*Chrysocyon brachyurus*), the Pampas deer (*Ozotoceros bezoarticus*) and the otter (*Lontra longicaudis*). These have been included in the list of recorded species considering the high probability of occurrence and the reliability of the testimonies. In the case of the jaguar, five people reported seeing the species in different sites within Paracel properties. The identified site is located within the Zanja Moroti ranch ($22^{\circ}35'49.29''S$, $57^{\circ}2'1.10''W$), roughly 100 meters from a watercourse in an area with considerably large forest patches, Trementina ($22^{\circ}44'10.28''S$, $56^{\circ}54'37.43''W$) and San Liberato ($22^{\circ}36'46.51''S$, $56^{\circ}53'18.23''W$). Jaguar tracks were found in two of these locations and additionally one of the people who reported the species showed the team a photo of an attack on a calf that meets the specific characteristics of this species. For this reason, *Panthera onca* is considered an indirectly recorded species, until direct photographs were obtained.

It is likely that this species is represented by one or very few individuals in the area, and uses the large patches of forest found on and outside the Paracel properties as a refuge. Likewise, it is possible that its movement is almost exclusively nocturnal between these patches and the riparian forests found in the area, so its probability of detection is very low.

Furthermore, the maned wolf (*aguará guasú*) was also reported by two people at different times in the same area, just north of the Estancia Soledad ranch, bordering the Paso Bravo National Park, additionally, during the dry monitoring activities, a maned wolf footprint was recoded in Santa Teresa. Estancia Soledad also happens to be the same ranch where the howler monkey was recorded. The otter was reported by several people in different areas, but always linked to watercourses; the species was sighted in Santa Teresa and Hermosa by the team members. Both the jaguar and the maned wolf could be flagship species, so it is extremely important that efforts be made to document their presence and monitor the use they make of the territory.

Descriptions of species that could not be fully identified were also received; for example, the “*tirika’i*”, which refers to a cat of the genus *Leopardus*, which based on

distributions and citations could be either *L. guttulus* (Nascimento & Feijó, 2017) or *L. geoffroyi* (Cuyckens et al., 2015). Both species are cited for the area in other data collections for fauna, but there is no documentation to support these records. The mention of this record deserves attention because both possible species are included in Appendix I of CITES and, furthermore, *L. guttulus* is categorized as Vulnerable at both national and international levels. Other probable species of conservation interest, such as the giant armadillo (*Priodontes maximus*) and the bush dog or *jagua yvyvy* (*Speothos venaticus*), were not recorded, neither directly nor indirectly through interviews. These three species fall under some category of national and international threat, and could be flagship species if their presence were confirmed in the area. A number of other species are cited for the area, but these were not detected during the surveys carried out during this first fieldwork campaign; these are, for the most part, marsupials, bats, and rodents. This is because the methodology and the sampling effort were mainly focused on medium and large mammals. Among the recorded species, six have been identified as being of special interest for conservation. Ecological aspects are briefly described for each, following Parera (2017) and Canevari & Vaccaro (2007), meanwhile their current conservation situations and main threats are based on IUCN (2021) and APM & SEAM (2017). These species are the jaguar (*Panthera onca*), the ocelot (*Leopardus pardalis*), the maned wolf (*Chrysocyon brachyurus*), the anteater or *yurumí* (*Myrmecophaga tridactyla*), the tapir or *mborevi* (*Tapirus terrestris*) and the white-lipped peccary or *tañycati* (*Tayassu pecari*). A summary of each of these six species is included in the [Mammalogy](#).

The effort especially aimed at bats, allowed to know more about this community since there is no published inventory in the study area; however, according to the work carried out to date (López - González et al., 1998; Gorresen & Willig, 2004; López-González, 2004, 2005; de la Sancha et al., 2017), it is estimated that there would be 33 Chiroptera species. Through the indirect methodology there were records of species, mostly insectivores, as highlighted in the literature regarding this guild with respect to the echolocation system and they can be more easily detected by acoustic recorders; in addition, a fish-eating species could be recorded with this method. Likewise, foraging activities could be identified in all sampling sites, which demonstrates their importance as a source of food resources for bat species. Vocalizations of bats that were not identified by the software or confirmed by the literature were documented as sonotypes.

Sonotypes are those vocal signatures that cannot be recognized, but are clearly different and can be grouped into different families and genera (Ochoa et al. 2000). The probability of other species present, even unrecorded for the area, is very high, so the development of more studies in the area should be taken into account and the two techniques used in this work (direct and indirect) must be combined. In Paraguay, knowledge about bats is incipient and scarce, so the work carried out with this group of mammals (such as the present study) is of utmost importance and yields novelties such as new records for the area, in this case that of *Saccopteryx leptura*, of the Emballonuridae family. This species, although it is listed by the IUCN as of Least Concern (<https://www.iucnredlist.org/species/19807/22005807>), reaches the limit of its distribution in Paraguay, and in the Red Book of Paraguay (Red Book of Mammals of Paraguay, 2017), is cataloged as DD; that is to say, of concern about the information gaps on the species. The other species registered (by the bioacoustic method) of the Emballonuridae family, *Peropteryx macrotis*, is also recorded for the IUCN as of Least Concern <https://www.iucnredlist.org/species/16709/22101100> , but in the Paraguay

Data Book of Paraguay (Libro Rojo del Paraguay, 2017), is classified as vulnerable (VU), because it has an extremely restricted distribution and few records of it are known in the country. Additionally, there are no updated records of this species in Paraguay.

The presence recorded of Phyllostomidae bats (*Carollia perspicillata*, *Artibeus lituratus*, *Artibeus planirostris*, *Glossophaga soricina*, *Platyrrhinus lineatus*) considered regenerators of secondary forests (because they disperse seeds and pollinate flowers of pioneer plant species in forests) (Gorresen & Willig, 2004), reveal a good ecosystem health of the study area that allows the recovery of the system in the medium and long term. In general, the results obtained are relevant for the sampling areas, since it allowed the registration of most of the species described for the area, belonging to five different families of the six present in the country (Phyllostomidae, Vespertilionidae, Molossidae, Emballonuridae and Noctilionidae). Regarding the richness of species, this is satisfactory, taking into account the sampling nights and the limitations when choosing the sampling points. It is estimated that species richness and novelties could increase as more areas are sampled and sampling repetitions increase, especially those far from the properties' headquarters, where there are native forests with different levels of degradation.

The innovative eDNA³ developed by Paracel in its preliminary finding adds a species which has not been referenced or recorded during the survey and this is the Naked-tailed Armadillo (*Cabassous chacoensis*), which once the full report is obtained, should be incorporated into the final list of mammal species. It should be noted that it was recorded within the baseline for the pulp mill, yet it is a new species for the plantation AoI. The other four species of global conservation concern have been already identified in the field surveys, except for the confirmation of the Neotropical Otter (*Lontra longicaudis*); while the Turquoise-fronted Amazon (*Amazona aestiva*), the Greater Rhea (*Rhea americana*) and the Black-and-gold Howler Monkey (*Alouatta caraya*) have their presence confirmed by the conventional methods. For the species of fish, the most abundant sequence for *Pimelodella* sp., is to be contrasted with the three species identified in this study, while *Hoplias* sp the most commonly detected species may be contrasted with *Hoplias misionera*. The final report will elucidate information on information for 195 fish, 30 amphibians, 78 birds, 50 mammals and 4 reptiles. In total, eDNA study included eight species categorised on the IUCN Red List: turquoise-fronted Amazon (NT, *Amazona aestiva*), greater rhea (NT, *Rhea americana*), Neotropical otter (NT, *Lontra longicaudis*), Chacoan naked-tailed armadillo (NT, *Cabassous chacoensis*), and black-and-gold howler monkey (NT, *Alouatta caraya*), White-lipped peccary (VU, *Tayassu pecari*), South American tapir (VU, *Tapirus terrestris*), and Giant anteater (VU, *Myrmecophaga tridactyla*).

Although fungi were not the main focus of this study, the presence of specialists was used to identify some specimens found. The description of the genera cataloged in this short survey showed that the number of species can be much higher, especially in the Riparian Forest (BR). Although the Cerradón species are of great importance, they are minor in occurrence. Fungi are natural bioindicators, which is why the occurrence of fungal species is associated with plant species. The mutualistic natural interactions between living organisms in forests are of vital importance, since some plants depend on these interactions for their existence. A larger and exhaustive sampling of fungal

³ NatureMetrics (2021)

species is highly recommended to obtain more data on the fungus / plant coexistence and for the preservation of suitable environments for both types of organisms. With a larger and representative sampling, which covers all the identified plant formations, it will be possible to know the mycobiota in an integral way and thus study its interaction and importance, whether ecological or even for the use of resources in sustainable development.

6.1.7 Conclusions – Flora, Fauna and eDNA

The study area was found with moderate to high anthropic disturbance; nevertheless, the first campaign of a rapid seasonal survey (rainy season) of the fauna and flora was carried out, fulfilling the objective of providing the first records for the resulting baseline and for future evaluations.

The 700 species of plants and 438 species of vertebrates recorded (besides the 40 species of fungi and other species of invertebrates) reflect the great potential of this site for conserving elements of the *Cerrado*, as well as other ecoregions that converge at this point, such as the Atlantic Forest and the Lower Chaco (Humid Chaco). Out of flora and fauna taxa, the diversity of fungi and invertebrates is still far from being known.

This study made it possible to survey and classify the vegetation formations of one of the most threatened, and yet lesser-known ecoregions at the country and global levels. The current knowledge of its biodiversity is based mainly on very old studies, dating back more than 100 years. The most recent studies date back from over the last three decades, mainly carried out applying the REA methodology and other floristic studies of specific taxa. This work reviews these studies and contributes towards the species expected to be found.

Although the *Cerrado* formations are present in the country as isolated mosaics within various ecoregions such as Alto Paraná, Amambay and mainly Aquidabán in the Eastern Region, as well as the *Cerrado* ecoregion in the Western Region, many typical species are common among them, while others are exclusive.

In spite of recent studies and publications that refer to the presence of various endemisms (Pena-Chocarro & De Egea 2018) as well as plant genetic resources (De Egea et al. 2018) of importance for food and agriculture -aspects of great importance and relevance worldwide- a more detailed analysis is required that falls outside the scope of this biodiversity baseline. The same applies to the fauna discussed throughout the different sections.

The study area is considered one of the hot spots of the dendroflora of Paraguay by Spichiger et al. (1995), for constituting the meeting point between two different Floras, that of the *Cerrado* and that of south-east and south Brazil (Flora of the *Cerrado* and Flora Paranaense). Indeed, from a comparative analysis carried out with the 228 tree species that these authors mention as typical of these Floras, it was found that 59 of them (25.9%) are present in the study area. Of these, 37.3% are common to the Pleistocene Residual Dry Seasonal Flora, 26.3% to the Paranaense Flora, 5.5% to the Dry Chaco Flora, 16.7% to the Humid Chaco Flora and 29 , 5% to the Flora of the *Cerrado*.

Eighty-one species of fish were found corresponding to 27 families within five orders and one class. The most abundant species was *Odontostilbe pequira* for the seven sites

(properties), followed by *Corydoras aeneus* and *Moenkhausia dichroura*. Only two species are of conservation concern, *Potamorrhaphis eigenmanni* (VU) and *Odontostilbe pequira* (LC). These findings are considered most relevant for the area and their unprecedented characteristic contributes to the knowledge of the fauna of these underexplored areas. Their association with water and ecosystem health makes these fish key elements to monitor.

In addition, they constitute the highest biomass compared to other vertebrates in some environments (U.S. EPA 2002). Depending on the scale at which they are studied, amphibians can be good indicators of the condition of natural systems (Heyer et al. 1994), given that they use several ecosystems during their life cycle. Consequently, their monitoring is recommended, in particular within ecosystems that are threatened or subject to activities that alter the landscape, such as its structure and the use of agrochemicals (pesticides).

Within this statement fish are also incorporated, due to their relationship with the aquatic environment as indicated. Although the dimensions and the high heterogeneity of environments of the study area have not allowed obtaining a complete resolution of the diversity of amphibians and reptiles in the area, the findings were important and suggest more studies in the field, with the addition of passive methods of captures such as fenced pit traps (Corn 1994; Willson & Gibbons 2010).

From the ornithological point of view, despite the fact that the natural communities of the Cerrado that were evaluated were altered, and several areas could not be covered due to situations unrelated to the sampling campaign (insecurity), they still harbored species with several important criteria, when considering this faunal group as a tool to monitor the changes that have occurred and which will occur in the future in the area. The significance of the riparian forests is highlighted, since they were the communities with the greatest richness and abundance of bird species, followed by the floodable savannas with isolated islets made up of woody plants and vines. These results clearly demonstrate the remarkable value of these biological corridors between the different zones, including nearby protected areas, as well as their relevance in terms of the provision of fundamental ecosystem services, such as the provision of water and soil support. The predominance of species of the Psittacidae family (parrots, parakeets and macaws), a group highly sensitive to extraction for illegal trafficking and loss of habitat, in all plant formations suggests that they serve as a refuge and source of food for the species of this family of birds.

The presence of macaws in the area has potential as an ecotourism attraction, which offers a sustainable conservation strategy, as well as an added value to the environmental commitment of the project. The presence of *Crax fasciolata* and *Pipile cumanensis* highlights the importance of forest formations since this species have few current records in Paraguay, especially in the Eastern Region. For this reason, it is essential to pay special attention to this species within these plant formations. Species such as the Greater Rhea (*Rhea americana*), NT at international level and *Seriema cristata*, are two outstanding species dependent of open natural communities such as savannas and cerrado fields, both species are easy to detect when present and could be good indicators of habitat quality given their specific habitat types. Within the less conspicuous grassland and savanna species, the *Sporophila* seedeaters are good indicators as these species are affected by changes in humid grasslands and these species develop seasonal movements because of refuges and food.

All these species are large, striking, and charismatic, qualities that strengthen the potential to be considered flagship species in the study area. The area is home to species of interest with different states of conservation at national and international level, which occur in the Cerrado, in addition to the species that use this area as a stopping point within their regional migratory routes, which makes them potentially indicator species for implement measures and strategies that make the undertaking's environmental commitment visible.

The species richness of mammals observed during this work is satisfactory taking into consideration the number of days of sampling and methodological limitations (risk of theft of camera traps, for example). Nevertheless, the fact that evidence of unidentified species was found means that additional sampling methods should be used to increase the list of species, specifically for the smaller mammal species (bats, rodents and marsupials) by employing the use of traps and acoustic methods. Furthermore, it highlights the need to increase the sampling effort in areas where species of high importance could be detected and documented, such as the jaguar, the maned wolf, the pampas deer, the giant armadillo and the bush dog, among others. The records of unidentified tracks and the record of the pantanal cat confirm how poorly studied the area is. Based on these results, the technical team expects more surprises and estimates that species richness will continue to increase as more sites are sampled or more replications are carried out.

Furthermore, the records of species of interest for conservation such as the jaguar, the maned wolf, the tapir, the giant anteater, the ocelot and the white-lipped peccary, highlight the importance of the area, and these species should be the focus of conservation and research efforts. All are charismatic species, relatively easy to monitor and have great ecological value within the fauna communities, as well as being representative species of the region.

The project could be viable and compatible with the conservation of biodiversity, considering criteria such as: avoiding the elimination / degradation of native forests, avoiding planting in springs, riparian strips, wetlands and seasonally flooded areas, maintaining biological corridors and buffer strips, restricting and controlling hunting, wildlife capture or harassment; and complemented with a program for fire prevention and biodiversity monitoring.

6.1.8 Ecosystem Services

Ecosystem services are the benefits that people, including businesses, derive from ecosystems (IFC Performance Standard 6). There are four types of ecosystem services (IFC, 2012): (i) provisioning services, which are the products that people obtain from ecosystems; (ii) regulation services, which are the benefits that people obtain from the regulation of ecosystem processes; (iii) cultural services, which are the non-material benefits that people obtain from ecosystems, and (iv) support services.

For this study, provisioning, culture and regulation are considered.

6.1.8.1 Provisioning Services

The main ecosystem services linked to the provision of communities is the use of water for food, consumption of wells, lakes and springs.

It is common in the DIA to practice fishing, both for sale and for self-consumption (for example, the towns of Paso Barreto, Paso Mbutu, Islería). In Direct Influence Area (DIA), from the 64 sampled fish species, ten species are used as subsistence fishing, while nine are used in commercial fishing and 23 are used for ornamental purposes, according to the following table.

Table 23 – Usage of recorded species in different fishing practices.

According to Natán report, hunting and fishing activities are one of the main sources of food for some indigenous families. The 92, 12% of the country's indigenous communities declare that they practice these activities. It is recognized that since the pre-colonial period, the indigenous people of the region lived in egalitarian societies and did not produce surpluses, the forest provided them with everything they needed for their subsistence. They traveled large areas to collect, hunt and fish, in addition to meeting their needs for clothing and tools. Hence the importance of these activities for people of indigenous communities.

In relation to hunting and fishing, the knowledge and practice of these activities are directly related to food. The communities hunt only edible animals and in the amount that is indispensable for feeding the community and family, avoiding indiscriminate hunting and respecting the fauna's breeding season. The main animals available for hunting within the IIA are armadillo, pig, fish, deer, coati, lizard, bird, turtle, anteater, monkey, capybara, and ostrich.

Seven mammal species of hunting interest can be included in this category. *D. novemcinctus* is considered, together with the limpet, the most tasty and appreciated wild animal meat by hunters (Sigrist, 2012). Similarly, *Dasyprocta* sp.; *H. hydrochaeris* and *M. gouazoubira* are usually hunted for sport or as a source of food.

C. thous; *L. pardalis* and *L. tigrinus* are under hunting pressure to obtain and market their skins.

In addition, the existing drinking water supply systems are supplied by groundwater, and, as for the communities that still do not have access to drinking water systems, the majority are supplied from deep wells, springs, cutwaters, rivers and streams.

Still in the context of water resources, wetlands are important ecosystems, protected by the Ramsar Convention, a Convention on Wetlands of International Importance, which is an intergovernmental treaty that provides the framework for national action and

international cooperation for the conservation and sustainable use of wetlands and their resources (WCRP, 2014). The characteristics of the natural resources of the Río de la Plata Basin indicate that the wetlands represent the main ecosystems of the region (WCPI, 2014).

These wetland areas are recognized as highly productive ecosystems and one of the most obvious indicators of their wealth and diversity are the wetland birds; these birds constitute a natural resource of great intrinsic human and ecological value, throughout history they have appeared prominently in human culture, as a source of food or ornamentation as well as in the folkloric sense (PMCIC, 2014).

These ecosystems perform extremely important functions such as: water reserve and purification, flood buffering, carbon sinks, sediment, organic matter and nutrient storage and/or export sites. In addition, they play a critical role in the life cycle of numerous species of fauna and flora and support trophic chains of adjacent ecosystems (WCPI, 2014).

Other than that, although regarding vegetation cover, it is noteworthy that the area is partly affected by anthropogenic occupations and economic activities already consolidated in the region. The forests are important because they provide ecosystem services also for the whole community in the influence area, providing them with timber (used for house construction), fauna (for subsistence hunting), flora (for food and traditional medicine), and harvested foods such as honey and fruit. The activities of gathering wild fruits are carried out by the indigenous families of the communities to provide themselves with food sources at different times of the year to complement their diet. In the country, 88.6% of indigenous communities declare that they practice gathering food from the forest, field or other places. The main sources of collection in the area are wild honey, coconut, guavira, yvaviju, pakuri and beans.

6.1.8.2 Cultural Services

During field surveys, in perception studies, many people have expressed the use of water resources for recreation/recreation (bathing, beach, fishing), highlighting the Aquidabán river.

Livelihoods are the capabilities, assets (which include both material and social resources) and activities necessary to earn a living (Ashley & Carney, 1999). In indigenous peoples there is usually a vision of interaction and coexistence with forests, biodiversity and ecosystem services. In this sense, the productive activities of subsistence of the communities cannot be separated from the conservation of the forests, since their protection is interdependent on the well-being of the communities.

The manufacture of handicrafts is a cultural and economic activity for many communities. In the country, 75.2% of indigenous communities declare that they dedicate themselves to this activity, with a greater participation of women, which represent 68.2% of indigenous artisans. Although the manufacture of handicrafts is considered as underdeveloped compared to the activities of agriculture, livestock, gathering, hunting and fishing in the area, it is an activity of interest to artisans that not only provides them with income, but is also a source of leisure that contributes to their overall well-being. The raw materials that are usually used for the manufacture of indigenous crafts in the departments of Concepción, San Pedro and Amambay are karaguata, takuara, seeds, wool, guembepi, karanday, feathers and soft woods.

Most of the population alternates agriculture and livestock with the production of handicrafts; These populations have always lived in conditions of extreme poverty with little support from the government and from organizations that channel their productive work towards the achievement of their needs and interests. Many of the artisan trades and their products have disappeared and consumption has drastically decreased as a result of the processes of migration and rural depopulation.

Traditional medicine activities are a constitutive element of the identity of indigenous communities, as it is linked, on the one hand, to the relation between health and disease and, on the other hand, to their worldview and magical, religious and empirical knowledge. For the practice of traditional medicine, indigenous people collect medicinal plants from their environment, known as pohã ñana, and perform prayers, songs and dances. In most cases tobacco is used as a primary plant for healing rituals carried out by spiritual leaders.

6.1.8.3 Regulating Services

For the care of the environment, the project will be governed by national regulations (water and effluent quality standards, zero deforestation, among others). With the highest international standards, which require permanent monitoring of environmental impacts, and the public dissemination of the results.

6.1.9 Land Cover and Land Use

Vegetation cover and PS 6 Type in Forestry DIA is divided in 5 classes type: native forest, riverside forest, Savanna/Floodable/Cerrado area, Grassland/Pasture/Agriculture area and Forest plantations. The percentage of vegetation cover in DIA is presented at the table and figure below:

Table 24 – Vegetation cover and PS 6 Type in Forestry DIA

Class ID	Class type	Area (ha)	%	Area (ha)	%
1	Native forest	52697.11	28.5%	144,487.26	78.14%
2	Riverside forest	8642.29	4.67%		
3	Savanna/Floodable/Cerrado	83147.86	44.97%		
4	Grassland/Pasture/Agriculture	31324.74	26.94%	40,429.79	21.86%
5	Forest plantations	9105.05	4.92%		
Total		184,917.05	100%	184,917.05	

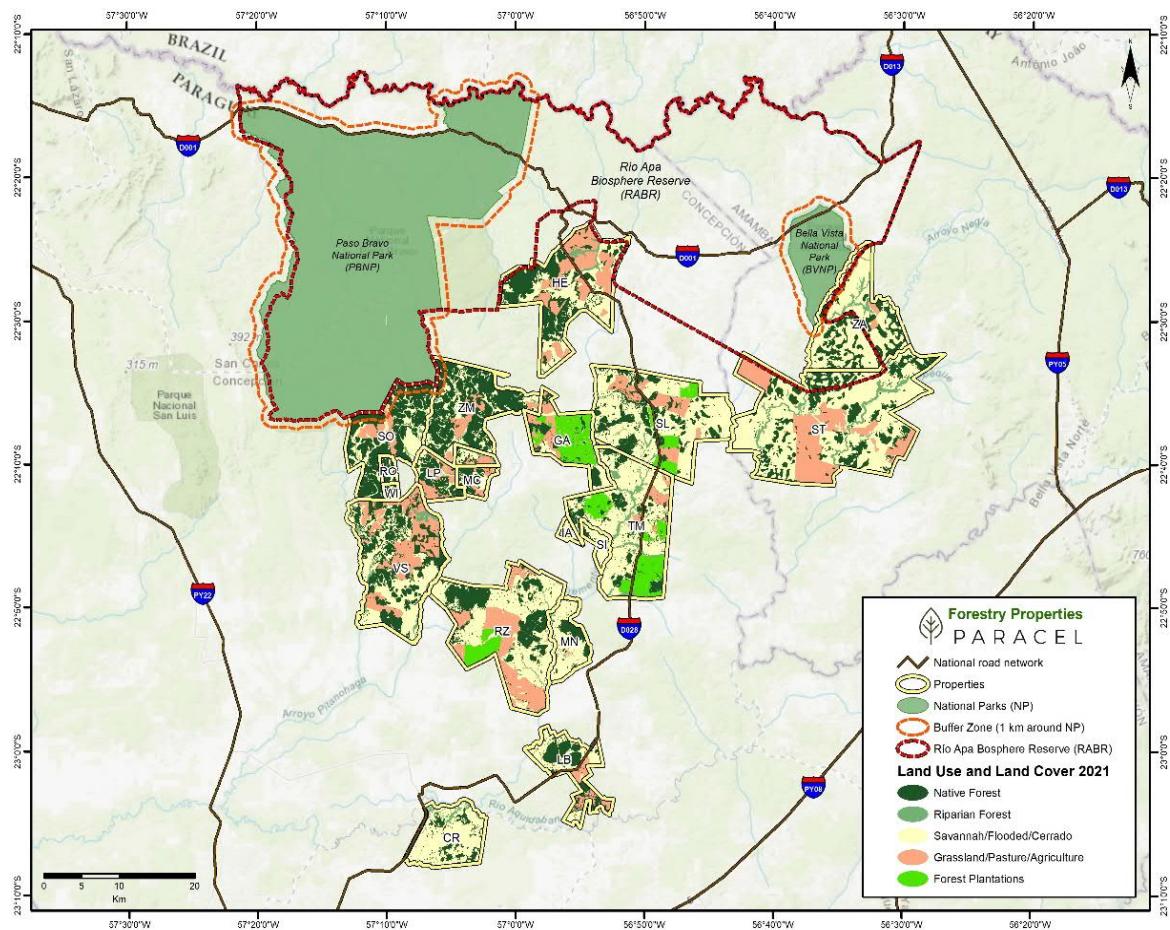

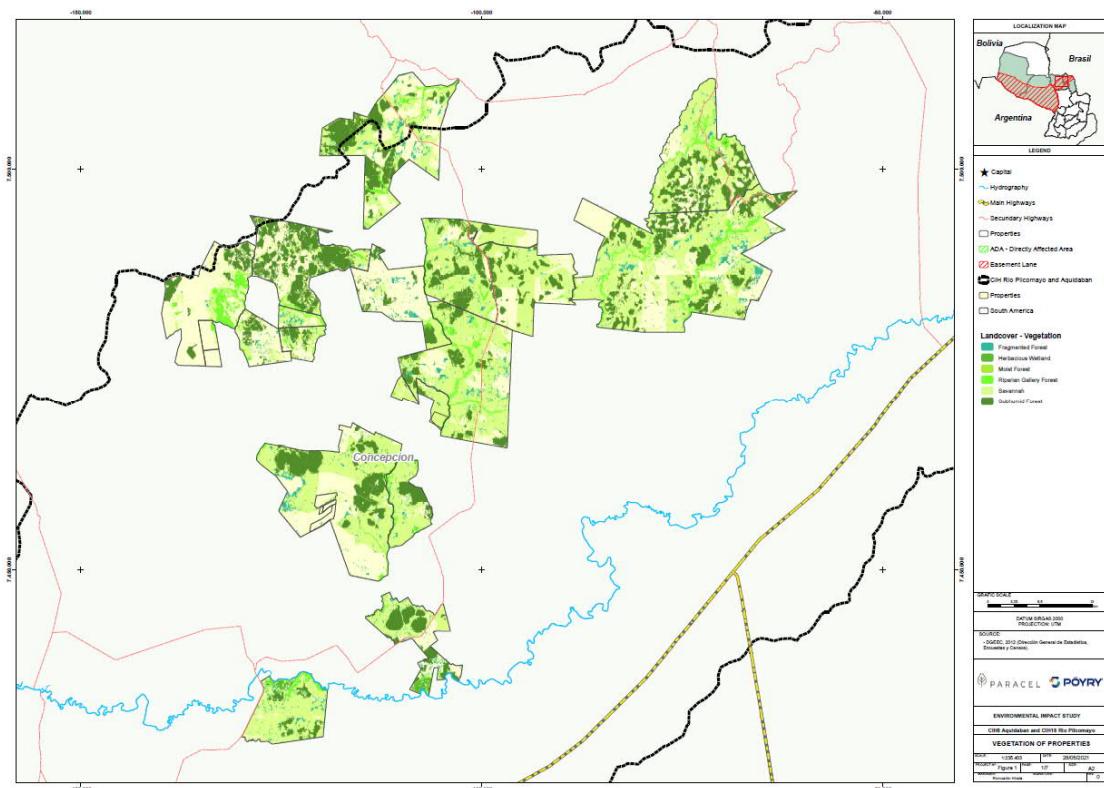

Figure 86 – Defined Land Use and Land Cover by Paracel

Noting that **modified land** consists of heterogeneous landscape consisting of cattle grazing, farming and other anthropological uses, as well as, undisturbed and degraded natural pasture types.

Modified land cover types includes: Pasture implanted with African grasses, manmade (areas, structure, and pavement not including roads), cleared areas, agriculture, agroforestry plantations, and roads. **Potential natural land cover types** of the pasture complex include wet grasses, and “clean” and “dirty” savannah, referring to the amount of woody stem vegetation. Both savannah types in the pasture complex are represented by a undisturbed and degraded forms. **Forest/Wetland** land cover consists of subhumid forests, riparian gallery forests, fragmented forests (which includes “Cerradon” open dry forests), and seasonal and herbaceous wetlands. Thus, the Potential Natural Land and confirmed Modified Habitat of Paracel’s Forestry Plantations percentage area is presented at the table and figure below:

Table 25 – Potential Natural Land and Modified Habitat of Forestry Plantations

PS 6 Type	Total		Area (ha)	Percentage
Potential Natural	144,487.26	Avoided/Conserved	82,513.48	44.62%
		Planted	61,973.78	33.51%
Modified	40,429.79	Restored	3,536.01	1.91%
		Planted	36,893.78	19.95%
Total	184,917.05		184,917.05	100%

**Figure 87 – Potential Natural Land and Modified Habitat of Forestry Plantations.**
Source: SINASIP: Paraguay National System of Protected Areas.

The Vegetation and Lan Use Properties Maps od PARACEL area are presented in **ANNEX III**.

In order to mitigate the forest plantation, Paracel defined criteria for establishing conservation vs planted areas, as showed at the table and figure below:

Table 26 – Paracel criteria for establishing conservation vs planted areas

Forest Management	Criteria
1km PNBV	Buffer area with a distance of 1 kilometer around the National Parks adjacent to the properties, where Paracel will not voluntarily make

1km PNPB	changes in the current use of the land, as a protection measure in the zone that continues to the protected area.
Biological Corridor	Area where Eucalyptus plantations will not be carried out. They do not correspond to areas of environmental liabilities, but will be conserved in its natural state or in confinement as a natural corridor area between the forest masses.
Non-plantable area	Area that includes areas of native forest, protective forests of water courses, or soils not suitable for planting (rocky, low flood zones, etc.)
Recomposition/Confinement	Areas of liability that must be restored (confined or recomposed) both by: 1) Zero Deforestation Law 6676/20 (a satellite image from 2005 was used); 2) Forest Law 422/73 (a satellite image from 1986 was used) and; 3) Law 4241/10 of Protective Forests of Water Channels (a buffer of 100 m was used on both sides of the water channels visualized in the current satellite image and the database of the National cartography of the National Institute of Statistics of the year 2012) .
Plantable area	Area available for Eucalyptus plantations without restrictions in environmental legislation. With the clarification that these are "potential" areas where prior soil analysis and on-site verification must be carried out to accurately determine their aptitude for planting.
RBRA - Río Apa Biosphere Reserve	In the areas where the RBRA overlaps with Paracel's properties, resolution 200/2001 was taken into account in its Art. 31 regarding biosphere reserves. Art. 31 The following are characteristics of the areas with the Biosphere Reserve management category: a) The property (s) on which the area is based may be public or private property, as well as those in the municipal public or private domain. b) Production must be carried out through environmentally compatible systems, promoting sustainable production; c) Possess at least 50% of the surface with minimal anthropic alterations, or in natural conditions. d) Carrying out activities aimed at maintaining Environmental Services; e) Carrying out activities aimed at the restoration of ecosystems; Y f) The administration of the area will be exercised by the Enforcement Authority.

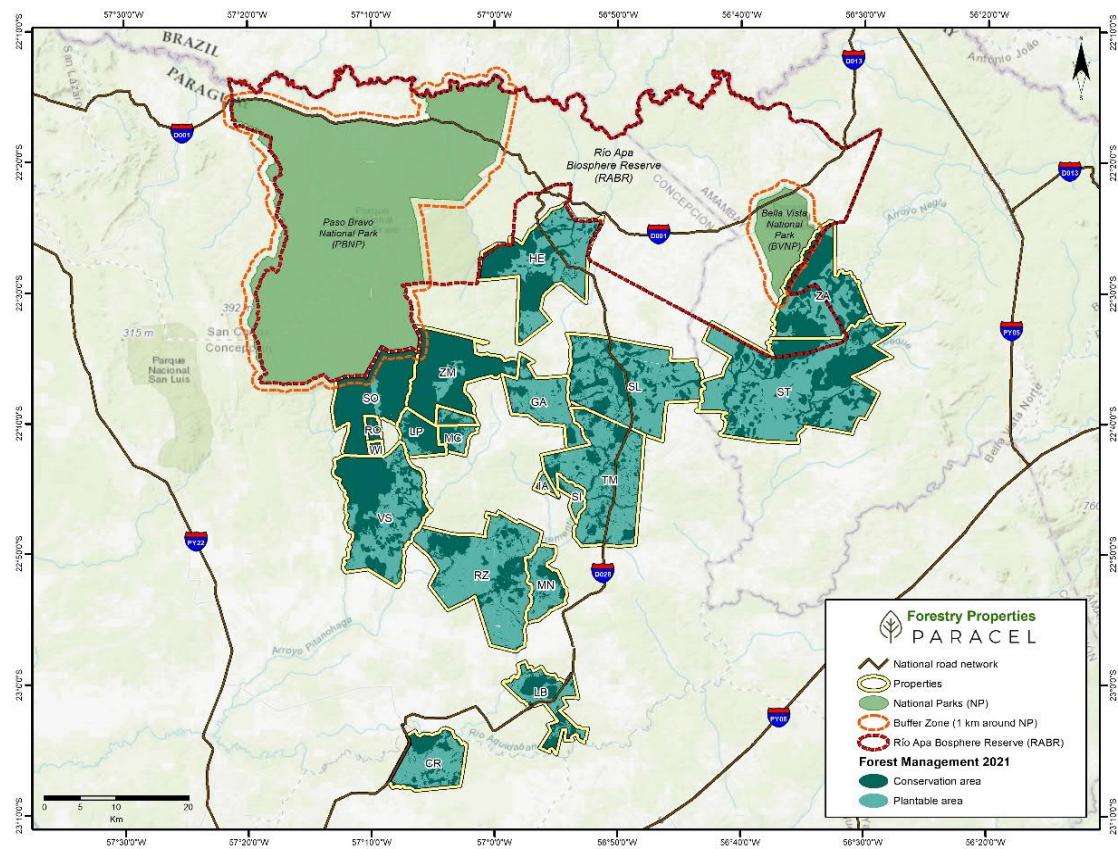

Figure 88 – Estimate Conserved vs Plantable area for Eucalyptus.

The overall calculation on potential natural and modified habitats within Paracel's plantation farms was made based on each property percentage land use presented on **ANNEX IV**.

1. INTRODUCTION

The biodiversity baseline study was developed on the properties of PARACEL company, which plans the construction and operation of a pulp manufacturing plant on the Paraguay River, designed based on the best available technologies, and managed by according to certified systems, both from the productive and socio-environmental point of view¹. The raw material (*Eucalyptus* spp.) will come from own plantations located mainly in Concepción Department and to a lesser extent, in Amambay Department. The plantations will be installed in a total of 20 properties (Figure 2–1), on areas that currently correspond to livestock use.

The study area is located within the Districts of Sargento José Félix López in Concepción Department and Bella Vista in Amambay Department, around 500 km from the capital city of Asunción, within the northeastern region of the Department of Concepción and belongs to the Aquidabán ecoregion (Res. SEAM Nº 614/13). Seven main sampling areas have been identified: Gavilán, Trementina, Soledad, San Liberato, Santa Teresa, Zapallo and Hermosa). The faunistic monitoring has been carried out systematically and according to a specific monitoring plan; the technical team has carried out a general survey, making it possible to create a list of species for the area as a biodiversity baseline. This information is based on a bibliographic compilation for the potential species to be present in the area and direct observations as a result of field sampling.

The study area is located mainly within the Cerrado ecoregion, which is ranked as Highest Priority at Regional Scale for conservation, based on an analytical system for evaluating the conservation status of the ecoregions (Dinerstein et al. 1995). In Paraguay, the Cerrado occupies relatively small discontinuous areas forming a mosaic pattern on a slightly undulating topography with sandy soils generally visible between the vegetation. It should be noted that, depending on the authors and the context, the Cerrado can be classified as an ecoregion, an ecosystem or a formation. For the purpose of this report, the formation of the Cerrado at a national level is classified under different ecoregions, due to the fact that there is no detailed study of its distribution (Marín et al. 1998, Basualdo & Soria 2002, Rolón et al. 2017).

In the case of this study area, the Cerrado converges with the contiguous Humid Chaco and Upper Paraná Atlantic Forest ecoregions resulting in the presence of a high level of characteristic transitional biodiversity of the main taxonomic groups, and which this study focuses on (plants, fish, amphibians, reptiles, birds and mammals), resulting from the interaction between the ecoregions and their convergence. Knowledge is scarce; however, in spite of this limitation, the region is widely recognized as an area of great importance for fauna due to its remarkable diversity, the presence of species that are either endemic or have a restricted distribution, as well as a considerable number of species that fall under one category of threat or another (Rojas et al., 2020; Critical Ecosystem Partnership Fund, 2017; Asociación Guyra Paraguay, 2004). To further this ecoregional complexity, the area is also influenced by wetlands.

¹ PARACEL. Terms of Reference 200907 PAR-IFC-TOR-BLS biodiversity. Pag. 1

The Paraná-Paraguay river and wetland system acts as a corridor for fauna and flora in a predominantly north-south direction, facilitating the dispersal of organisms from tropical regions to temperate latitudes and from the coastal regions of the Río de la Plata estuary towards the Paraná River and its tributaries (Ringuelet 1975, Giraudo et al. 2004, Arzamendia 2006, Neiff et al. 2006). As a unique characteristic, this region harbors the southernmost distribution of the Cerrado biome, a global diversity hotspot (Myers et al., 2000), reaching into the departments of San Pedro, Canindeyú and Caaguazú in the Eastern region of Paraguay (PNP, 2013; SEAM, 2013).

The study area includes the four types of typical environments found within the Cerrado region; *Bosque Alto* (Tall Forest), *Cerradón*, *Campos Sucios* (Dirty Fields) and *Campos Limpios* (Clean Fields), which have undergone different degrees of alteration mainly as a result of livestock use. Influences from neighboring ecoregions such as the Humid Chaco and the Upper Paraná Atlantic Forest are also evident (Hayes et al. 1995). The presence of Chacoan plant communities is frequently evident by *Copernicia alba* (*karanda'y*) palm groves mixed with typical elements of the Cerrado. Where deeper and more complex soil types are found, tall forests or elements typical of the Upper Paraná Atlantic Forest appear. This mixture of species and landscapes, or rather, this zone of gradual transition results in a local enrichment effect since it creates an opportunity for the convergence and confluence of species that are unique to the individual ecoregions.

Based on the databases from three different sources on the species richness of Paraguay's ichthyofauna, the numbers range from 259 (www.fishbase.org) to 395 (www.faunaparaguay.com/fishlist.html), and up to 451 (www.guyra.org.py). Published studies estimate that there are between 129 (Ramlow, 1981), 189 (Mandelburger et al., 1996) and 298 species (Bertoni, 1939). According to the Koerber & Vera checklist (2017), a total of 307 species of fish were confirmed and listed, four of which are threatened and another four species are introduced exotics. Earlier studies on the ichthyofauna within the study area are scarce and superficial; however, Insaurralde (2012) mentions 37 species for the Aquidabán River, which is relevant considering that the Trementina Stream (*Arroyo Trementina*) is a tributary of this sub-basin. Other water courses of this sub-basin are Negla, Pitanoahaga and Napegue. Also, the Hermosa stream was sampled and this flows water northward into the Apa River.

The Apa river basin holds 14,960 km², and in the national territory this basin includes the districts Concepción, San Carlos and San Lázaro (Concepción); in addition to Bella Vista and Pedro Juan Caballero (Paniagua, 2011). This basin involves in the Paraguayan territory several protected areas, some of management categories implemented with private resources, and others are national parks (Paso Bravo National Park; Serranía de San Luis National Park; Bella Vista National Park;s) and Tagatiyami Nature Reserve; Tagatiya Cerrado Nature Reserve, all of these located in the drainage area of the Apa River Basin, which gives it a strong component of sustainability and wealth of environmental tourism, whose production capital has not yet been capitalized in Paraguay, due to lack of infrastructure, access roads, especially, where the "Ojo de Mar" is also located, a natural feature of crystalline water in a geological fracture (Benítez, 2008).

Fish are considered suitable bioindicator organisms as they cover many links in the food chain, are capable of accumulating toxic substances and react easily to low concentrations of mutagenic agents (Minissi et al., 1996; Gustavino et al., 2001).

Final report.

Biodiversity Baseline Study of Paracel Properties. Paracel S.A.
8 May 2021.

Around 54 species of amphibians and 91 species of reptiles have been recorded within the study area (Brusquetti & Lavilla 2006, Caballero et al. 2016, Cacciali et al. 2016, Cacciali & Kohler 2018; Smith et al. 2012, Weiler et al. 2013), which represent 61% and 50% of the total number of species for each group present in the country, respectively. In Amambay and Concepción, for instance, there are recorded species of anurans that are not found in any other region of the country, such as *Physalaemus centralis*, *P. marmoratus*, *Leptodactylus furnarius*, *Rhinella scitula*, *Dendropsophus jimi*, *D. elianae*, among others, which suggests this area as an endemic center for anurans in Paraguay (Cabral et al. 2020). Furthermore, although it would seem that the reptiles were simply a sub-set of species from the Atlantic Forest (Cacciali & Ubila, 2016), there are also species exclusive to plant formations of the Cerrado region, such as *Norops meridionalis*, *Colobosaura modesta*, *Salvator duseni*, *Bothrops pauloensis*, among others (Cacciali et al. 2016), which gives the area an exclusive conservation relevance.

There are 464 species of birds that occur within the Cerrado area (65% of the national birdlife), of which 11 species are considered endemic to the Cerrado in Paraguay. Furthermore, a number of species of great importance, either as a result of their ecosystemic role or because of their level of threat in Paraguay, occur in the Cerrado (*Crax fasciolata*, *Pipile cumanensis* g., *Rhea americana*, *Ara chloropterus*, *Ara ararauna* and *Anodorhynchus hyacinthinus*) (Silva 1997, Guyra Paraguay Sf).

Regarding the mammalian fauna, the study area has few taxonomic studies and systematic surveys throughout the region (Critical Ecosystem Partnership Fund 2017, Red Paraguaya de Conservación en Tierras Privadas, Guyra Paraguay and Conservation International 2008; Guyra Paraguay 2004). Furthermore, most of these surveys were carried out in areas set aside as reserves on private lands, which leaves vast extensions of territory unsurveyed. Some scientific collections exist and some specific scientific work has been carried out where mammal data has been presented for this area (Gamarra de Fox & Martin 1996, Lowen et al. 1996, Melquist 1984); however, most of data compiled on the fauna of the region has resulted from the work carried out during expeditions, casual observations, interviews and Rapid Ecological Assessments for the preparation of technical reports (MAG 1996, Macedo 1996, Altervida 2003, FMB 2004, NLT 2007, Rojas et al. 2020). Rumbo (2010) lists 66 species for the Cerrado in Paraguay, based exclusively on records published in academic articles and museum specimens.

The Guyra Paraguay Biodiversity Database (BDBGP) lists 96 species for the Cerrado (*Campos Cerrados*); this database also includes historical records, data gathered during rapid ecological assessments as well as unpublished observations, always maintaining a strict approach regarding the inclusion of records. Bearing in mind the convergence of other ecoregions, an extensive review of the knowledge regarding the mammalian fauna of the “Northern Block of the BAAPA (Upper Paraná Atlantic Forest)” carried out by Guyra Paraguay (2004) has been consulted, compiling information from more than 20 studies carried out in the region, including the southern part of the area of interest for this study as well as the northern part of the Humid Chaco in the Western Region of Paraguay. In this review, a list of 115 mammal species was compiled based on reliable records for the study area. Once the lists were combined and the taxonomy of the cited species updated, a list of 103 possible species for the study area was obtained, which represents 57% of the country's species.

In Paraguay, 181 species of mammals have been identified (Sancha et al., 2017), of which 24 species fall under some level of threat category at an international level, while 12 species are considered DD (data deficient) (IUCN, 2021). At a national level, 32 species fall under some level of threat category, 29 are considered with insufficient data and 2 are not evaluated (APM & SEAM, 2017).

Among the possible species for this work, some are cited as being of special importance for conservation such as jaguar (*Panthera onca*), giant armadillo (*Priodontes maximus*), giant anteater (*Myrmecophaga tridactyla*), maned wolf (*Chrysocyon brachyurus*), tapir (*Tapirus terrestris*), lipped peccary (*Tayassu pecari*) and pampas deer (*Ozotoceros bezoarticus*). All these species have in common that they are mammals with very specific habitat requirements, are threatened at either a national or international level, are medium or large in size, and can be monitored, using them as "umbrella" or "flag" species to achieve conservation objectives for most of the mammalian communities in the region. In summary, the mammalian fauna of the region is little known, more than 50% of the country's species are listed as possible for the study area, and among these species there are some of special interest for conservation.

Bats, among mammals, stand out for the ecosystem services they provide as seed dispersers, pollinators of different plant species and as controllers of insect pests (Barros et al., 2006; Kunz et al., 2011; Voigt & Kingston, 2016). These ecological functions added to other characteristics such as a wide taxonomic and ecological diversity, an extensive geographical distribution, in addition to the ease of sampling and identification and a high relative abundance, make these mammals a key group to maintain or recover ecosystems and to be bioindicators of the health of an environment (Barros et al., 2006; Medellín & Víquez, 2014; Voigt & Kingston, 2016). Likewise, their low reproductive rate makes them respond quickly to environmental changes since populations can decline abruptly, which allows detecting changes in the ecosystem in the short term (Medellín & Víquez, 2014; Voigt & Kingston, 2016).

Bats constitute the second most diverse order of mammals in the world and the most important group of mammals in neotropical humid forests in terms of numbers of species (approximately 1,400) (López-González, 2005; Simmons & Cirranello, 2020). The importance of bats lies in the fact that they are responsible for the balance of the tropical ecosystem, this can be appreciated and verified by the eating habits of the different species of bats, some are insectivores (the most numerous compared to other bats in the tropical area), frugivores, nectarivores, fish-eaters, hematophages and omnivores. Tropical bats have great potential as indicators of levels of habitat disturbance and offer a broad view of the health of an ecosystem as they exploit different trophic resources (Fenton et al., 1992). In Paraguay, the chiropterofauna is made up of 58 species organized into six families: Mballonuridae (2), Noctilionidae (2), Phyllostomidae (21), Natalidae (1), Vespertilionidae (15) and Molossidae (17) (López- González, 2005; Stevens et al., 2010; Owen et al., 2014; Moratelli et al., 2015). Regarding the trophic guilds, insectivores, omnivores, and hematophagous are present throughout the country, with the exception of *Diaemus youngi* distributed in dry Chaco and in floodplains, and frugivores restricted mainly to the east and floodplains of the country (López- González, 2004; López-González, 2005).

Most of flora and fauna species are monitored through conventional methods, though there are more advanced and recent technologies such as camara traps, bioacoustics and environmental DNA (eDNA) which will be boarded in this study. Camara traps are more widely used for mammal species in Paraguay and bioacoustics for bats is being pioneered in the country. On the other side, eDNA is new for Paraguay. This analysis is organismal DNA that can be found in the environment due to the presence of specimens. Environmental DNA is originated from the cellular material hold by organisms (via skin, saliva, excrement, or other remainders of animal activity) and these released into aquatic or terrestrial environments that can be sampled and monitored using new molecular methods. Such methodology complements the more conventional methods and give information which in many cases is not obtained by traditional methods, especially with cryptic species.

Final report.

Biodiversity Baseline Study of Paracel Properties. Paracel S.A.
May 2021.

Finally, fungi are eukaryotic, heterotrophic organisms and differ mainly from plants by lacking chlorophyll and by having chitin walls in their cells, apart from storing glycogen as a reserve substance. They are of vital importance for all types of ecosystems due to their role as decomposers, converting organic matter into inorganic so that they can be used by other living organisms. In addition, they form associations with vascular plants, allowing them to resist climate changes, helping to absorb nutrients through hyphal and root associations (Curtis et al. 2000; Wright and Albertó 2002).

Final report.

Biodiversity Baseline Study of Paracel Properties. Paracel S.A.
May 2021.

2. METHODOLOGY

General: The proposed methodological intervention focuses on the Rapid Ecological Assessment (REA). The REA methodology integrates multiple levels of biological and ecological information for effective decision-making on conservation, planning, and management (Sayre et al. 2000). It allows to collect, interpret and interrelate, at the office and field level, all the scientific - technical information possible to obtain on the study area in a limited time (Sobrevila & Bath 1992). The information is collected through a process known as stratified sampling, which allows the analysis of data at a gross level or of little detail, this guiding the collection and analysis of data at a level of greater detail.

For this proposal, as considered relevant, level 2 and level 4 data (from a REA) were applied. At the Level 2: High resolution images, to produce a Vegetation Cover Map. This vegetation cover map made it possible to identify not only the existing ecosystems within the ecoregion(s) but also the identification of natural communities. These landscape units were referenced and quantified in terms of area. And, Level 4: Field work, to produce information on species diversity and habitat quality. As planned, species diversity was measured in terms of specific richness and abundance.

In addition, in order to offer a complete baseline, existing maps and cartographies were used, including a map of ecoregions, changes to land use and deforestation events, a map of priority areas, water resources, edaphic and climatic resources, to offer complete information for decision making.

The basic steps, according to the methodology of a REA include: Definition of objectives, Data acquisition, Data analysis, Analysis verification, Product generation, Recommendations and applications. This analysis allows generating the evidence and demonstrating the routes for obtaining the information so that the same methodology, with or without modifications, could be repeated in the future, thus giving the best possible use to the Baseline Study.

In order to understand the number of species collected and the sampling effort, techniques for accumulation curves and biodiversity indices (Shannon-Weaver and Simpson) were used which are described in each of the taxa.

The biodiversity baseline study was divided in two field campaigns, one during the rainy season carried out from 12th to 22nd December 2020, and from 25th March and 5th April 2021, and another in the dry season, carried out 9 to 20th May 2021 developed early in the dry season. The dates of March 25 as part of the rainy season, such as the beginning of May for the dry season, were carried out according to the requirements of the contractor to complete the biodiversity base sampling. In total, effective field tasks of 10.5 days were carried out in December with four sampling areas (AM), 9.5 days in March with three AMs and 9.5 days of sampling in May in seven AMs areas with a duplicated team working synchronously. This gives a total of 29.5 days of effective field work with an investment of 4.21 days per AM in total for both seasons, or 2.1 days per AM per season.

Five workshops for the preparation and selection of sampling areas were carried out using information based on GIS as well as lists of cited species and of possible occurrence at the sites<, additionally two workshops more in between the rainy season and the dry season, to plan accordingly and optimize the field campaign. Representative areas were selected based on the criteria of representativeness and convenience.

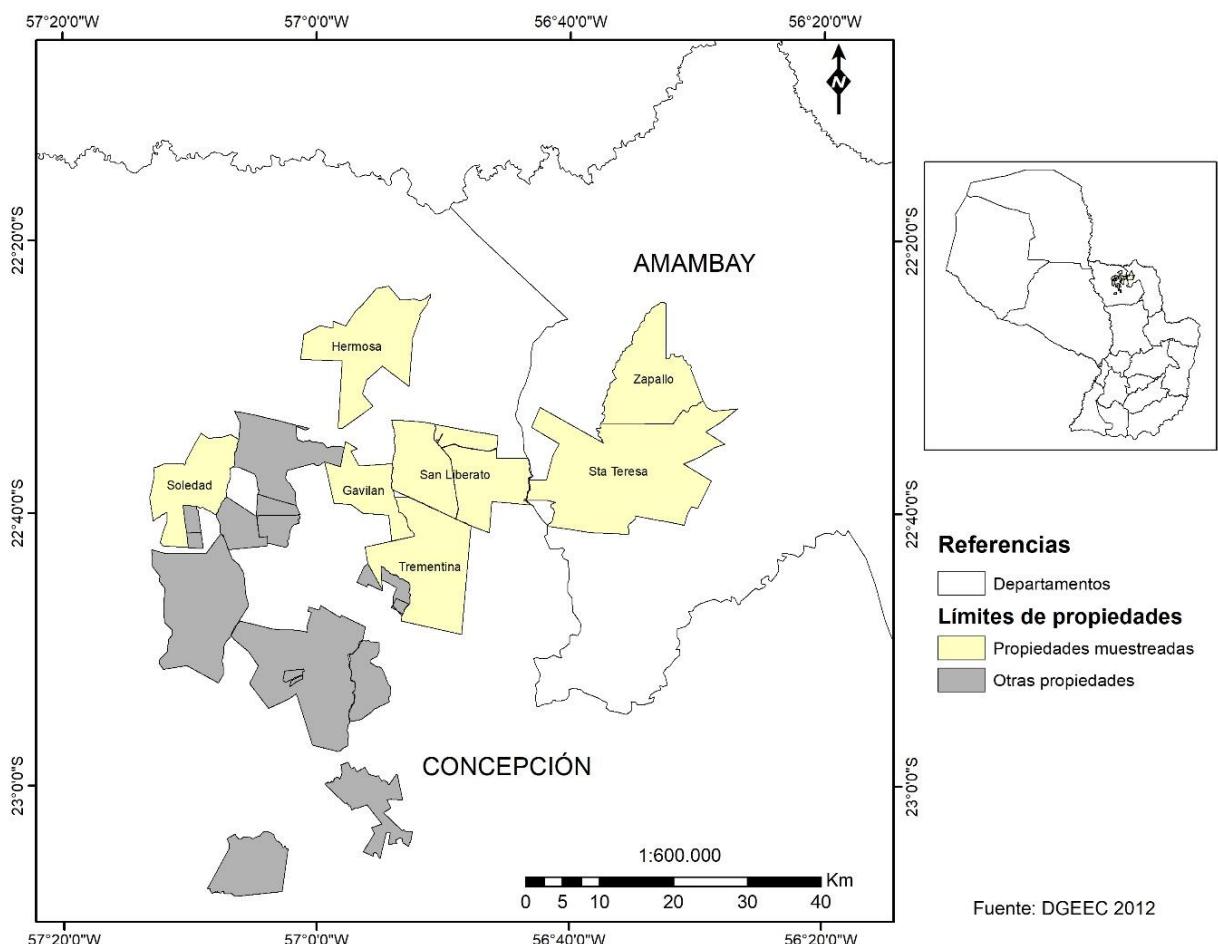

An extensive bibliographical search was carried out for all taxonomic groups, focusing on those occurring within the departments of Concepción and western Amambay, so as to be prepared for what we could expect to find at the sites, based on possible species records from scientific articles, scientific collections and records from other surveys carried out in neighboring properties as well as in conservation areas.

Meetings were held with professionals from PARACEL and at their invitation with experts from international financial entities, after these meetings the decision was made to expand the first field campaign from December 2020, and to carry out a second sample at the end of the rainy season (March and April), in addition to designing a sampling for chiroptera using modern bioacoustics techniques and environmental DNA sampling in some 190 localities that had water available. These two components, chiropterofauna and Environmental DNA, will have separate reports. However, bat sampling and monitoring carried out asynchronously with the team (in April) is integrated in this baseline. A preliminary report on eDNA in the samples is integrated in this report. Additionally, data on other biodiversity species, such as invertebrates and fungi, add information to this baseline report.

The studies were carried out mainly on four properties (*estancias*), which are referred to as sampling areas. These were identified as representative areas of the ecoregions and include all the environmental units previously identified as relevant. The sampling areas are *Soledad*, *Gavilán*, *Trementina* and *San Liberato* (Figure 2–1). Sampling stations, sampling points and transects in all taxonomic groups were associated to the identified plant formations while ichthyofauna was the only group in which complementary stations took place.

Final report.

Biodiversity Baseline Study of Paracel Properties. Paracel S.A.
May 2021.

Figure 2-1 Map showing sampling areas

In terms of fieldwork, methodologies were carried out according to the type of taxa being studied, applying direct and indirect methods, as well as employing the use of drones to confirm the GIS analysis where necessary. At all times, the sampling sites were guided by the natural communities and a botanical survey (Table 2–1, Figure 2–2). The various specialists worked together, comprehensively, documenting all records thoroughly. Movements between sampling sites were made to secure any relevant record that might enrich the biodiversity baseline (“casual records/sightings”, in the REA methodology); furthermore, night patrols were also carried out in order to increase the probability of finding the more cryptic species. The local inhabitants and ranch personnel were contacted *ad libitum* to inquire about the presence of observed species. The entire team worked with any available digital platforms (@Avenza Maps) taking advantage of these for photographs and geolocations. During monitoring early in the dry season, adjustments in the methodology were done for security reasons in the field which did not affect data collection except for some timetables which will be detailed accordingly.

To determine the degree of threat according to the International Union for Conservation of Nature (IUCN), the website of the Red List was consulted (<https://www.iucnredlist.org/>); meanwhile, the degree of threat at a national level was determined based on the official resolutions of the Ministry of the Environment and Sustainable Development (MADES): Res. MADES N°470/19 for flora, Res. MADES N°433/19 for amphibians, Res. N°254/19 and SEAM N° 632/17 for birds and mammals, and MADES Res. N°206 for reptiles.

To determine whether any species were included in a CITES Appendix, the website of the Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES) was consulted (<https://cites.org/esp/disc/species.php>). For the identification of uses, various types of bibliographic sources were consulted, and complemented further based on the knowledge of experts and local inhabitants, as well as observations during fieldwork (in the case of melliferous species and consumption by fauna).

Plants and Vascular Flora. For the characterization of plants and vascular flora (see [List of species with common names and conservation status](#)), a preliminary classification of the plant formations and communities was carried out and the sampling sites were established during deskwork. Data was collected from 34 Sampling Stations (EM) of 50m x 4m for forest formations and 50m x 2m for *campos cerrados*, *campos sucios*, and savannas. Similarly, 25 circular Observation Points (PO) with a 10m radius were set up and complemented with casual sightings (records of relevant/representative species outside EMs and POs). All species sighted in EMs, POs or OCs were identified and recorded in field forms, following Sayre et al. (2002). All fertile specimens were collected (whole herbs and cuttings from subshrubs, shrubs and trees) and deposited in the Herbarium of FACEN / National University of Asunción. Non-fertile specimens were collected in the case of missing determinations. Plant environments and communities were identified and described, specifically recording data on dominant and rare species. Environments and species were also recorded photographically (<https://drive.google.com/drive/folders/1fyBdOR8KgePNILg6s8N9AjKrzCmZdir?usp=sharing>). The plant formations were characterized following the criteria proposed by Mereles (2007), Prado (2000) and Spichiger et al. (1995). The list provided in the results section contains updated scientific nomenclature, based on internationally accepted databases and specialized publications.

Table 2-1 Summary of Sampling Sites (original names in Spanish remains for comparisons)

Nº	Site	Code	Formation/Community	Geographical Coordinates	Altitude (masl)
1	Gavilán	EM1	Floodable Savanna (Unnamed stream) Sabana inundable (Arroyo sin nombre)	22°40'15"; 56°54'00"	138
2	Gavilán	EM2	Degraded Tall Forest (<i>Attalea phalerata</i>) Bosque Alto degradado (<i>Attalea phalerata</i>)	22°40'20,3"; 56°53'44,7"	155

Ichthyofauna. The methodology was replicated in every sampling except for night surveys during the dry season. For the ichthyological survey, active methods were used with cast nets, hand nets and trawling nets as well as manual fishing [Ichthyology \(fish\)](#). At night, cast net and manual fishing techniques were used, in addition to crab and umbrella-type traps, each specimen was photographed and released again employing the catch and release method. At each monitoring point, various combinations of fishing methods were carried out, following a strict procedure: from the marked point three trawls/drags to the left and to the right and ten attempts with the hand net each side, manual fishing (if the site allows) for two hours and several attempts with the cast net. Two umbrella-type traps with eight openings and one of the crab-type traps were also placed on each side, totaling six traps per sampling site. These traps remained in place for approximately 30 hours. For the lentic environments, cast net and manual fishing techniques were employed. Furthermore, the types of aquatic environments were recorded, including dates and coordinates. Eighteen sampling sites (Table 2–2) were surveyed during the days of fieldwork. Ichthyofauna was the only group to include additional sampling sites (Figure 2–2).

Table 2-2 Ichthyological sampling points within the study area

Sampling Sites	Geographical Coordinates	Habitat Classification	Aquatic Environment Type
Point 1 (Ea. Gavilán)	22°40'9.34"S; 56°54'0.39"W	Lotic	Stream

Herpetofauna. Two field campaigns were developed as done in the other groups. Both campaigns were developed in a similar way in the sampling sites, when possible, with adjusted timetables due to daylight duration is shorter during the dry season. Active searches were carried out by day and by night over 20 days along sampling transects ranging 200-300-500 meters for each of the associated plant formations identified (Figure 2-2) (See information [Herpetology](#)). A total of 12 transects during the rainy season with four repetitions in each (except in two of them in which three repetitions, and in three of them two repetitions); thus reaching 40 samples in BA (18), CC (4), SA (4), SI (6), BR (8) and CD (2). The searches involved observational walks during times of greatest foraging activity; that is, during the morning until noon (10:00 – 13:00) and in the afternoon just before sunset (16:00 – 19:00). Bearing in mind that amphibian and reptile activity times vary substantially at a specific level, potential shelters for frogs, lizards and snakes -such as under logs, rocks and burrows of other vertebrates- were also inspected during in each walk (Heyer et al. 1994, McDiarmid et al. 2012). A total Of 94 lists over 54 transects ([Herpetology](#)). Random searches were also carried out whenever possible.

During the dry season, the search method was the same with adjusted timetables and less repetitions due to logistic issues. Daylight timetables were 09:30 to 13:00 and later during the day before sunset (15:-17:30). A total of 38 transects were done in the following plant formations: BA (9), CC (1), SI (14), BR (6), CD (2), SA (9), completing in this way 73 lists ([Herpetology](#)). No night sampling was carried out.

During the rainy season, amphibian breeding sites were sampled, which were identified during the day (permanent or temporary bodies of water) and by night employing a random search based on auditory scans. Based on the amphibian behavior of having species-specific advertisement calls, where males call females to breeding sites (Duellman & Trueb 1994, Emerson & Boyd 1999), vocalization recordings were employed to identify and record species, making use of the available sound guides (De la Riva et al. 2000, Haddad et al. 2005, <https://amphibiaweb.org/lists/sound.shtml>) as well as the herpetologist's own database of sound recordings. To confirm the identifications, the vocalizing species were located whenever possible with the aid of a headlamp. Individuals were manipulated either by hand or occasionally with a snake hook or forceps. The following sources were used to consult amphibian taxonomy: Brusquetti & Lavilla (2006), Smith et al. (2012), Weiler et al. (2013), Lavilla & Brusquetti (2018), Magalhaes et al. (2020). In the case of reptile taxonomy, Cacciali et al. (2016), Cacciali & Kohler (2018) were used.

Final report.

With the data obtained, the total richness was calculated in the entire study area and also in each sampled plant formation. Accumulation curves were generated in the EstimateS program (Colwell, 2013) of species and Chao1 and Jack 1 estimators used to determine how many more species could possibly be present. To compare the diversity between areas, the Simpson and Shannon indices were calculated with the Past v.4 program (<https://www.nhm.uio.no/english/research/infrastructure/past/>).

Ornithofauna. Bird observations were made at the sampling sites (Figure 2–2) in the six natural communities visited (BR, BA, SI, VA, CC, CD) (see [Ornithology](#)) by recording the number of individuals of each species by means of 72 transects (four per community) found along 150-meter transects within 15-minute intervals. These observations were carried out during the first three hours after dawn, since this is considered the time of day with most bird activity (Blake 1992 and Ralph et al. 1996) (Figure 2–2). Further observations were made during the afternoon (15:00 to 17:30) prior to a decrease in activity of the diurnal birds to further enrich the inventory and increase the sampling effort through these repetitions, completing the survey by means of 303 lists generated by transect, and 54 lists outside the transects by occasional records. Certain species were also recorded through interviews with local inhabitants and with specialists who either visit often or know the area well; although these interviews do not take into consideration the number of individuals for each species, they do contribute to the total species richness for the area. With regards to the materials used for the observations, we can mention a 10 x 42 binocular and the Identification Guide to the Birds of Paraguay (Narosky & Yzurieta 2006). Furthermore, sound databases were used for playback, including Bird Sounds from Southern South America and Xeno-canto (2005), with the purpose of maximizing the possibility of obtaining more records (such as those endemics to the Cerrado or of probable occurrence), as well as for the validation of the vocalizations heard in the field. For the post-processing of the data back in the office, the taxonomic classification was based on Remsen et al. (2020), meanwhile, bird nests were identified with the aid of a guide to the nests of birds in Paraguay (*Guía de Nidos de Aves del Paraguay*; De la Peña 2010), the state of occurrence was based on Guyra Paraguay (2004), and Silva (1997) was used to determine the species endemic to the Cerrado. In order to support the characterization of the records, the CITES database (UNEP-WCMC 2020) was consulted to determine which species are included. Finally, the IUCN Red List (IUCN 2021) was used to determine the threat categories at an international level, and the MADES Resolution No. 254/19 “Updated list of protected wildlife species: Class Aves” was used to determine the threat categories at the national level.

Mammalian Fauna. Both direct and indirect survey methods were employed. For direct data collection, intensive searches were carried out in which all observed mammals and their traces were recorded, including footprints, feces and other signs of presence (See [Mammalogy](#)). The searches were carried out both on foot and with vehicles through the various natural communities identified, both by day and by night based on the most typical activity patterns of mammals. A total of eighty-three sampling units with transects, camera traps and mist nets. A total of 30 sampling stations for twelve camera traps were set up for different periods of times with rotating locations according to the explorations with a total of 114 nights/traps in the different plant communities (Figure 2–2). This was done to increase the probability of detecting cryptic or rare species. Fifty linear transects of 200 meters long and 5 meters wide were surveyed in six of the identified natural communities (BR, BA, SA, SI, CC and CD). According to the temporal and spatial possibilities, repetitions were carried out on different days and in different places for each analyzed formation. Likewise, data from chiropterans were collected through the use of three mist nets located in points near headquarters to facilitate the review and work with them, these networks were opened and revised according to the logistical possibilities, totaling six nights of sampling.

This is for the rainy season; though, in the transition to the dry season a special bat sampling was developed (see below). All the data obtained directly were assigned to the corresponding natural community. Additionally, indirect data were collected through interviews with local workers and residents, first consulting about the names and behaviors of the mammals and then corroborating the identifications with printed photographs or photographs taken by the interviewees.

The statistical analyzes were carried out taking into account only the data obtained in the linear transects and the camera traps. These analyzes included the construction of a species accumulation curve for all samplings, and the calculation of chao1 and jackknife1 richness estimators for each plant community that had more than 10 sample units (BR, BA, SI and SA) (Thompson and Thompson 2010); Likewise, the estimation of the Shannon-weaver and Simpson diversity indices (Magurran 2004) and the construction of range-abundance graphs (Feisinger 2004) for the community in the entire sampled area. All analyzes were performed with the Estimates software (Colwell 2013) and with the R software (R Core Team 2020) using the BiodiversityR package (Kindt and Coe 2005).

Specialized guides were used for the identification of mammals, their footprints and other signals (De Ángelo 2017, Canevari 2007, Villalba & Yanosky 2000). Furthermore, the identification of species according to their category of threat at a national and international level was carried out following the Red Book of Mammals of Paraguay (APM & SEAM 2017, Resolution SEAM N°632/17 "Updated list of protected wildlife species: Class Mammalia") and the IUCN Red List (IUCN 2021), respectively. The general taxonomy follows Wilson & Reeder (2005) with updates considered by Sancha et al. (2017), but accepting the change proposed by Segura et al. (2013) for the species *Herpailurus yagouaroundi*.

For a better understanding of the field distribution, sampling stations and observation points (EM, PO), ichthyological points and stations (E), as well as location of camera traps (CT) are depicted in Figure 2–2.

Additionally, a survey was carried out especially oriented to bats, which was carried out using two methodologies: direct (mist networks) and indirect (bioacoustics) methods. During seven consecutive nights (April 10 to 16 of this year), five mist nets 9 m long and 2.5 m high (hours: 5:00 p.m. to 11:00 p.m.) were placed at the selected sampling points of each area (for specific localities see [Distribution of sampling points](#)). The captured specimens were photographed, measured and identified, determining their species. For the identification of the specimens captured with the mist nets, morphometric measurements of the body were taken (body length, tail length, ear length, forearm length) as well as data on sex, reproductive status, age and weight of the individual, after this procedure the bats were released. The keys used for identification were López - González (2005) and Díaz et al. (2016).

Mist nets are an effective method for species of the Phyllostomidae family, as they forage mainly in the understory, while for insectivorous bat families (eg. Molossidae and Vespertilionidae) whose feeding mode and echolocation system influence the type of flight (maneuverability, height) decreases the probability of capture in nets. Therefore, the traditional monitoring (mist nets) was complemented with acoustic monitoring, which consists of the identification of ultrasound vocalizations emitted by the different species of bats through the echolocation system they use to obtain food, communication and foraging. For this methodology, the active acoustic method was implemented for 40 minutes (hours: 7:40 p.m. to 8:00 p.m.) each of the seven nights at each established sampling site. An Echo Meter Touch Pro 2 acoustic detector (Wildlife Acoustics-Maynard, Massachusetts, United States) was used. An angle of 45 ° and the height of the device were taken into account to optimize the emission range of the acoustic sample (Pinilla-Cortéz & Rodríguez-Bolaños, 2017).

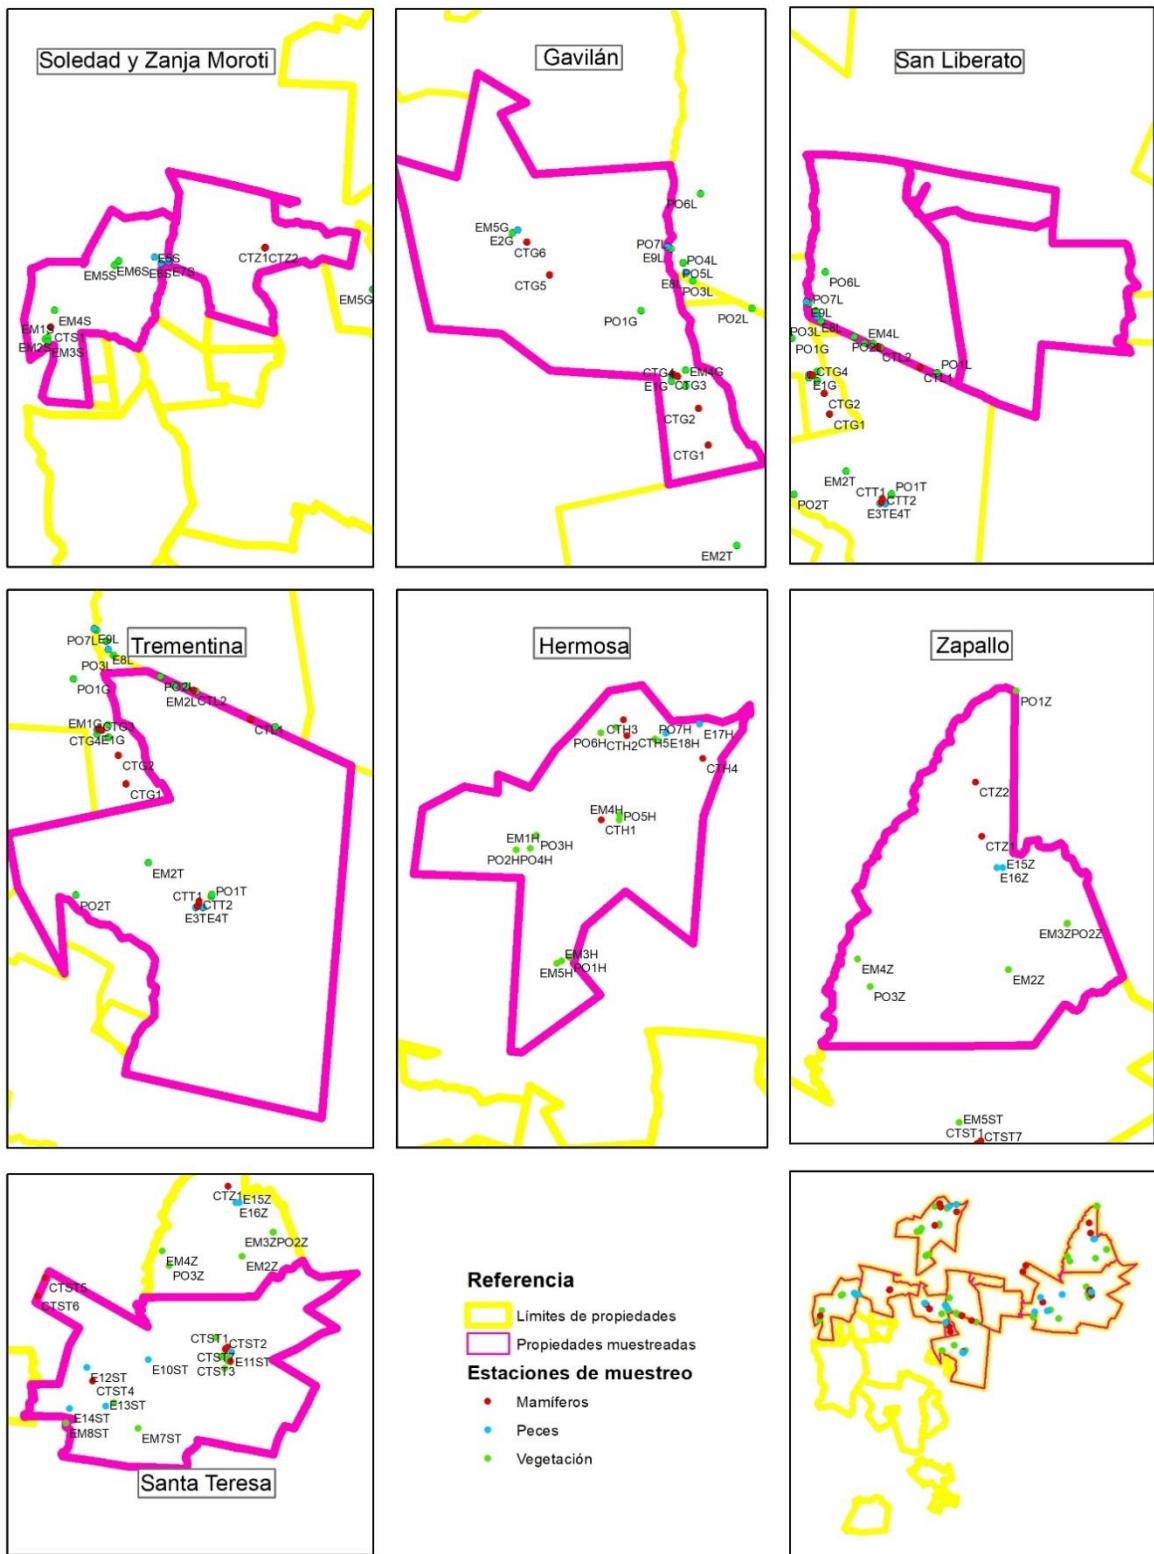

Final report.

Biodiversity Baseline Study of Paracel Properties. Paracel S.A.
May 2021.

Also, in each sampling site during the seven nights a recording station was installed; for this, the Song Meter SM4 BATS-FS recording equipment was used connected to an external omnidirectional ultrasonic microphone (Wildlife Acoustics-Maynard, Massachusetts, United States); and passive acoustic monitoring of the bats was carried out (from 7:00 p.m. to 6:00 a.m.). The equipment was installed at a minimum height of 1.5 m from ground level. For the analysis and identification of the ultrasonic vocalizations recorded by the SM4BAT and the Echo Meter Touch Pro 2, the Kaleidoscope Pro software (Wildlife Acoustics-Maynard, Massachusetts, United States) was used. Throughout the sampling work, the Biosafety Protocol implemented by the Latin American and Caribbean Network for the Conservation of Bats (RELCOM) (https://www.relcomlatinoamerica.net/images/PDFs/Manual_de_manejo_de_murcielagos.pdf), in such a way that during the handling of bats, N95 mask was used and constant hand washing and alcohol sanitation were used.

The complementary samples of fungi and invertebrates were random. The fungal specimens were located and randomly collected and photographed in situ, enumerated and dehydrated. Later deposited in Fungaria. For taxonomic identification, they were macroscopically described taking into account size, texture, color changes and substrate. For partial identifications, a bibliographic review of scientific articles, magazines, taxonomy manuals and pictorial atlases was carried out to catalog the possible species of fungi found in the place.

Final report.

Biodiversity Baseline Study of Paracel Properties. Paracel S.A.
May 2021.

3. RESULTS

3.1. Sampling areas and ecorregions

The *Cerrado* in Paraguay occupies relatively small discontinuous areas forming a mosaic pattern. As a formation, the *Cerrado* is classified under various ecoregions (Figure 3–1 and Figure 3–2); however, it became evident that the study area is more of a convergence between the *Cerrado* and the contiguous Humid Chaco and Upper Paraná Atlantic Forest ecoregions, more in line with what was proposed by Dinerstein et al. (2017). With this in mind, the study area presents a *Cerrado* - Atlantic Forest transitional area to the south and east, meanwhile to the west and south, the study area presents a *Cerrado* - Humid Chaco transition. This confluence results in unique characteristics in terms of the assemblages of fauna and flora present.

Figure 3-1 Location of properties based on MADES Ecoregions (Resolution 614/2013)

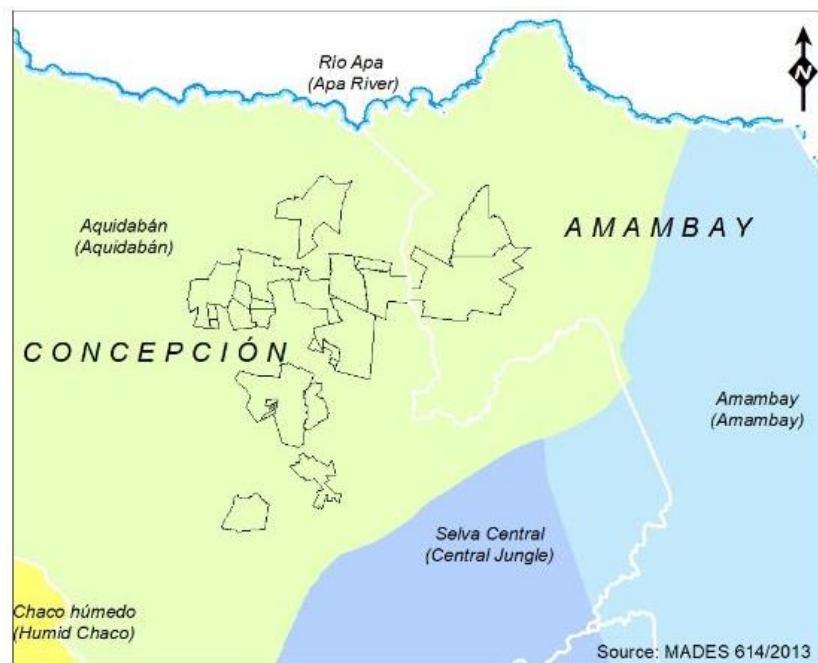

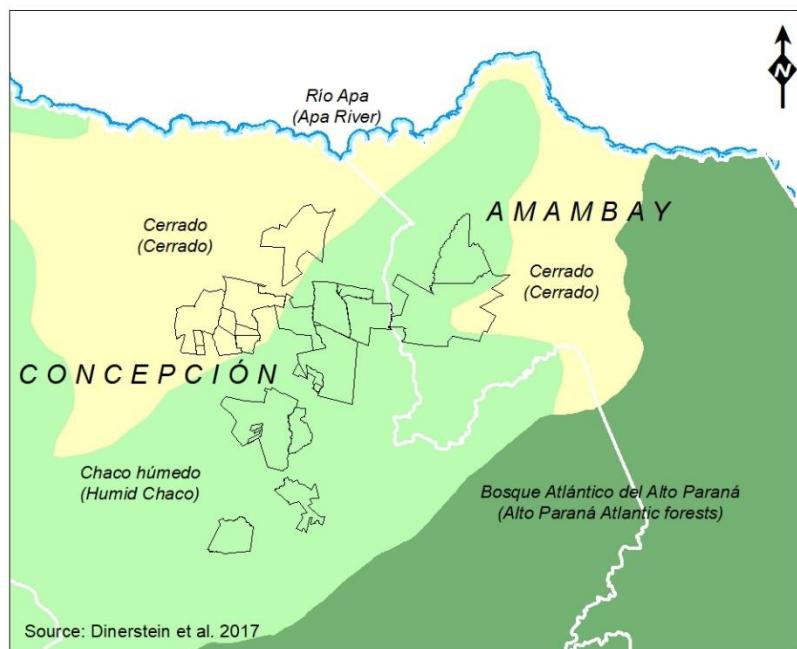

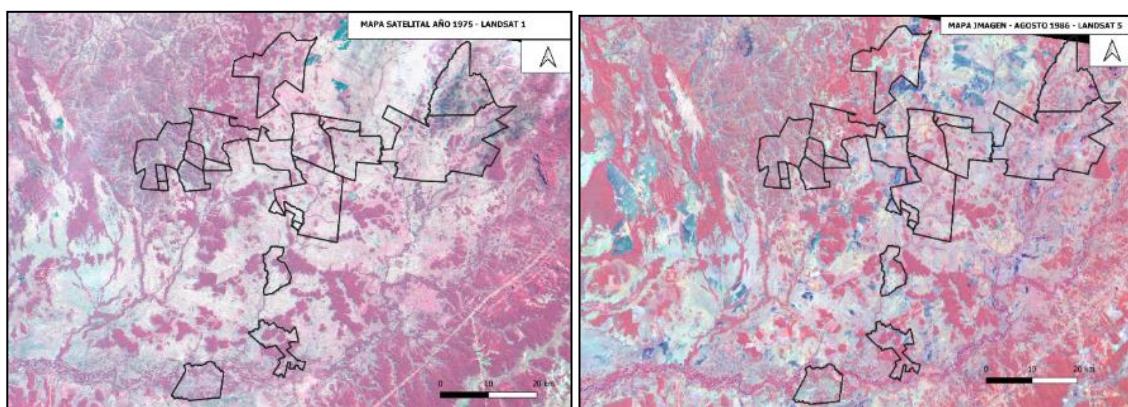

Figure 3-2 Location of properties based on Ecoregions by Dinerstein (2017)

In both biogeographical and ecoregional terms, the area is located within the *Cerrado* in a broad sense, yet it is common to find environments that correspond to the Humid Chaco in some properties, while others present elements and environments that correspond to the tall forests of the Atlantic Forest of Alto Paraná.

Within the study areas, tall forests and forest patches develop on the higher grounds with different soil characteristics; this vegetation presents a floristic structure and elements of tall forests ([Vegetation and Flora](#)). The presence of these forests is easily identifiable in historic images (Figure 3-3) that allow us to visualize the study area prior to the changes made in the productive landscape.

Figure 3-3 PARACEL properties on satellite images (Landsat 1) from 1975 and 1986

Ref.: Vegetation is seen in red tones, darker and more solid red areas represent forests, and lighter and less solid red areas represent sparse vegetation and/or of less height, and lighter tones represent natural grasslands

Final report.

Biodiversity Baseline Study of Paracel Properties. Paracel S.A.
May 2021.

3.2. General information

The floristic richness for the study area is comprised of 770 species of vascular plants, belonging to 373 genera and 97 botanical families. All the systematized information and record data are presented in a spreadsheet that can be accessed through the following link: <https://drive.google.com/file/d/1zN4bHbeze2IL-k2-GfZJ7W8lxch5nLmt/view?usp=sharing>. Also the information about common names and conservation status (national, regional, IUCN) is found in the same spreadsheet.

In terms of fauna, a total of 463 species of vertebrates were recorded belonging to 110 taxonomic families among the four taxa surveyed: 81 species of fish, 59 species of amphibians and reptiles, 260 species of birds, and 63 species of mammals (Table 3–1). All information has been systematized by taxonomic group and the data is presented in a spreadsheet which can be accessed through the following link: <https://drive.google.com/file/d/1260aFeg4zNJetUBfqqlW1ThlMcPqEA15/view?usp=sharing>. Also the information about common names and conservation status (national, regional, IUCN) is found in the same spreadsheet.

Species richness ranks as follows: birds (260), fish (81), mammals (63) and, amphibians and reptiles (59), with the taxonomic families following the same descending order for the two most abundant taxa (50 for birds, 27 for fish) and a reversed order for mammals (20) and amphibians & reptiles (13).

Table 3-1 Fauna and flora species richness

Taxonomic Group	Number of Species	Number of Families
Fish	81	27
Amphibians & Reptiles	59	13
Birds	260	50
Mammals	63	20
Pteridophytes	22	08
Monocots	139	15
Dicots	539	74

During fieldwork, the opportunity was taken to record species other than the taxa focused on in the diversity baseline study, including fungi and invertebrates. The collection of images and latter identification resulted in the mention of a total of six species of fungi, one spider and one grasshopper, as well as other invertebrates including twelve species of butterflies ([Other species identified](#)) in the field campaign of December, and 21 species of fungi with photographic records, five of them with gastronomic importance and nine of medicinal importance, collected during the March-April field campaign (see fungi report in [Fungi species recorded](#)). In May campaign, 40 species of fungi with photographic records were registered, of which 6 of them were of medicinal importance and one of gastronomic importance. In the low and high savannas, an abundance of Psilocybioides fungi of the genera *Psilocybe* and *Panaeolus* was found in the manure of herbivorous animals; however, only one species associated with Poaceae of the genus *Hydnopolyporus* was found in low savannas.

3.3. Plant formations

The following **eight plant formations or plant communities** were identified, three of which correspond to forest phytophysionomies and five to savannas: Degraded Tall Forest, Riparian Forest, *Cerradón*, *Campo Cerrado*, Dirty Fields (*Campo Sucio*), High Savanna and Floodable and Flooded Savanna, each with varying degrees of richness (Figure 3–4).

Plant formations or communities for Paracel properties embrace 179,713 hectares where based on 300 sampling and validation points on spectral information from satellite images allowed expert discussions which ended in the clear identification of Savanna, Forest, Riparian Forest, Implanted pasture/Agricultural crop, Forest plantations, and Waterbodies. Savanna (53%) is the most widely represented followed by forests (16%) and Implanted pasture/Agricultural crop (14%), and others. The document https://drive.google.com/file/d/1POx8_5UiVdN9gCdH7-vtFmbg_oOA-9tx/view?usp=sharing in detail depicts information on the methodology and the results of spatial distribution and estimation of areas.

The **Degraded Tall Forest (BA)** is characterized by presenting an average height of 12 m (which can reach up to 18 m) with three strata; the middle and lower strata being the ones with the highest density and diversity of species. In this formation the understory is not very dense, with few epiphytes and lianas. The natural regeneration of some tree species was noted. There is evidence of selective harvesting of its most valuable species and the invasion of exotics in the clearings. The soil is sandy in texture, red in color and covered by a thick layer of leaf litter. In this formation, six surveys were done with 127 species recorded.

The **Riparian Forests (BR)** follow water courses, and are generally contiguous with floodable savannas. They are characterized by having an average height of up to 14 m (which can reach up to 18 m) with three strata, the lowest being the one that presents highest density and diversity of species. It is important to highlight the presence of tree species belonging to the *Cerradón*. In this formation, the understory is sparse, with few epiphytes and lianas; however, the natural regeneration of tree species is visible. There is evidence of selective harvesting of its most valuable species as well as the presence of cattle. The soil is sandy, and covered by abundant leaf litter. In this formation, 15 surveys were done and 179 species were recorded.

The ***Cerradón* (CD)** is a plant formation characterized as an open semi-deciduous forest, presenting a height of up to 16 m, with three strata, the middle and lower strata being those with the highest density and diversity of species. Most of the tree species are typical of the formation and can also appear in more open formations such as the *Cerrado*. Most of the species are adapted to periodic burning, by presenting thick, corky and cracked bark. The understory is very open, with few epiphytes and lianas. Not much can be observed in the way of natural regeneration of tree species. The soil is sandy, shallow, covered by abundant leaf litter, and with rocky outcrops appearing in certain sectors. In this formation, six surveys were done and 128 species were recorded.

The ***Campo Cerrado* (CC)** is a type of savanna formation, characterized by the dominance of sub-shrub species, with highly developed underground structures. Herbaceous species are present in proportionally lesser quantity and represented, among others, by numerous species of grasses forming large patches. Evidence of periodic burning was noted. The soil is sandy, the topography is undulating and in certain sectors with rocky outcrops. In this formation, three surveys were done and 152 species were recorded.

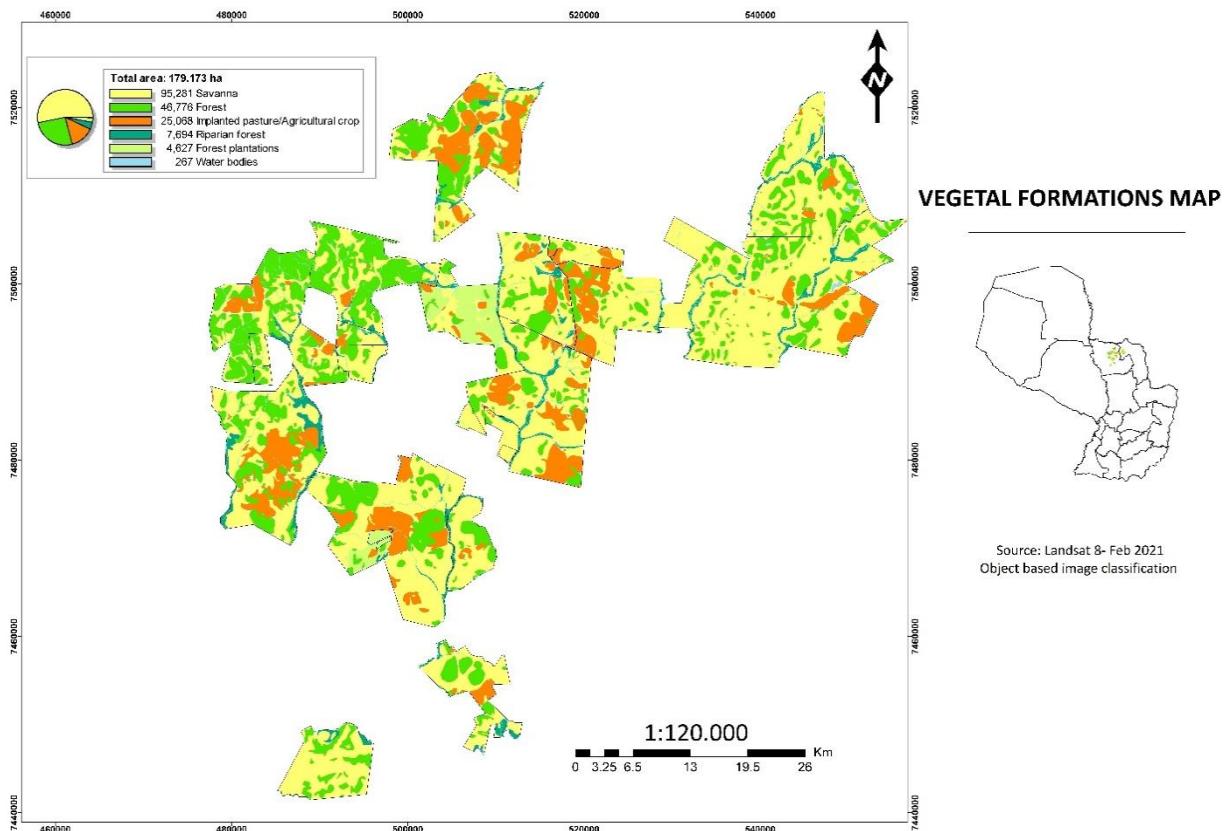

The **Dirty Field** or **Campo Sucio (CS)** is a phytophysiology of the *Cerrado*, which also presents a predominance of sub-shrub species forming extensive patches of several individuals, with characteristic species of the formation and some typically ruderal. Evidence of extensive grazing is noted, such as bare and compacted soil. It occupies the higher parts of the terrain, with undulating topography, sandy soils, and with little leaf litter. In this formation, three surveys were done and 124 species were recorded.

The **High Savanna (SA)** formation occupies the highest parts of the terrain, which are contiguous with forest formations. They present a mainly herbaceous cover with predominance of grasses, mainly *Elionurus muticus (Espartillo)* and *Aristida* sp., as well as other herbaceous species and some trees either as isolated individuals or in small groups or patches. They are prone to extensive grazing and periodic burning. The presence of large patches was also recorded, mainly of *Syagrus campylospatha (Jata'i mi)*. The soil is sandy. In this formation, seven surveys were done and 180 species were recorded.

The **Floodable Savanna (SI)** formation occupies the lowest parts of the terrain and borders with the forest formations. They present a mainly herbaceous cover with a predominance of grasses forming large patches, as well as other herbaceous aquatic and palustrine plants, and some trees either as isolated individuals or in groups forming small patches. In certain sectors, the presence of large patches, mainly of *Syagrus campylospatha (Jata'imi)*, were also recorded. At other sites, the presence of isolated individuals of *Copernicia alba (Karanda'y)* and *Acrocomia aculeata (Mbokaja)* was observed, as well as *Machaerium hirtum* at an arboreal level. Within certain sectors of the localities surveyed, the presence of bodies of water was observed, presumably formed some time ago by the damming of small water courses, and that have since been colonized by aquatic and/or palustrine plant species, either free-floating or bottom-rooted, depending on the depth of the water. Based on the verification of certain evidence, this formation is prone to extensive grazing as well as periodic flooding and burning. In this formation, 13 surveys were done and 283 species were recorded; thus the plant formation with the highest biodiversity.

The **Flooded Savannah (SIn)** formation is a large wetland, characterized by the dominance of few species, including Cyperaceae and Fabaceae, mainly *Aeschynomene* aff. *americana* growing in isolation. This savanna has permanent water and an organic substrate. Cyperaceae species are dominant and they cover a large area. Other registered species are: *Eleocharis* spp.; *Utricularia* spp., *Hibiscus sororius*, *Ludwigia nervosa*, *Nymphoides indica*, *Pontederia* aff. *Subovata*. In a few sectors, there appear floating vegetation (embalsados) of about 10 to 15 meters in diameter, colonized mainly by woody plants of the Onagraceae, Fabaceae and Malvaceae families. Some registered species are *Habenaria* aff. *repens*, *Mayaca sellowiana*, *Myrsine* sp., *Cecropia pachystachya (amba'y)*, *Bacopa* aff. *salzmannii*, Pteridophyta, Melastomataceae, *Xyris* sp., *Hydrolea* aff. *spinosa* var. *paraguayensis*. Also included within this formation is the aquatic-marsh vegetation registered in several places where there is presence of water bodies, either natural or artificial, of variable extension and depth, mainly linked to the availability of water for livestock. In this category, one survey was carried out and 25 species were registered.

Figure 3-4 Plant formations in the different properties

As a result of the baseline study, the presence of the different plant communities or formations has been mapped (Figure 3-4), and the FFPRI-CIF / FCA (2012) map, with it is possible to compare the changes that have occurred (Figure 3-5). Also, the 2020 land cover map (Figure 3-6) provides evidence of predominance of sabanoid formations. The complete description, including structure and characteristic species, is presented in the Vegetation and Flora [Vegetation and Flora Annex](#).

The Savanna formations are the ones with the greatest floristic diversity, with the Floodable Savannah standing out, with the highest number of species, approximately 100 species above the High Savannah, plant formation that follows in diversity in decreasing order (graph in [Richness of vascular flora for plant formations](#) depicts the total richness of all natural communities). According to Mereles (2007) the Savannas are very frequent plant formations in Paraguay, they constitute large areas of grasslands with woody plants grouped on islands or isolated woody ones; They are developed in both natural regions of the country. According to the prevailing types of soils and the anthropic intervention, the savannas can be: palmlands (with hydromorphic soils or not), "espartillares" grasslands (*Espartillo* grass), park savanna, among the most common ones.

The plant formation with the least floristic diversity is the Campo Sucio, which, as already mentioned, is a Cerrado phytogeography, with species typical of the formation and some typically ruderal, this resulting mainly from the history of use.

May 2021.

3.4. Floristic richness

The floristic diversity of all the identified plant formations was determined based on direct observations, collections and processing (in the field and in the office) of more than 3,500 specimens of vascular plants (both fertile and sterile).

The flora richness of the studied área is represented by 700 species; 373 genera and 97 families. Eight Families, 15 genera and 22 species are Pteridophyta; 139 species, 58 Genera and 15 Families are Monocotyledonae and 539 species, 300 Genera and 74 Families are Dicotyledonae. Based on Mereles (2007)'s estimates regarding the richness of vascular plants for Paraguay, consisting of some 6,500 species, this figure represents 10.8%. Of the 97 Families recorded, the 10 Families with the highest number of species are Fabaceae, Poaceae, Asteraceae, Cyperaceae, Euphorbiaceae, Malvaceae, Rubiaceae, Myrtaceae, Apocynaceae and Sapindaceae, in decreasing order of importance, as shown in Figure 3-7.

Figure 3-7 Families with highest biodiversity identified within PARACEL properties

All plant formations, the flora and the fieldwork process were recorded by approximately 10,000 digital photographs, which are included in the annex of [Vegetation and Flora](#), and systematically though the following link: <https://drive.google.com/drive/folders/1n0Yd4R0zqLjEctiTd-tKVLcQVxE135KJ?usp=sharing>.

The **endemic flora** (Peña-Chocarro & De Egea 2018) is represented by three species: *Bidens chodatii* (Asteraceae), *Ipomoea* aff. *aemilii* (Convolvulaceae) and *Arachis hassleri* (Fabaceae). Of the total species recorded, 18 are included in the National List (as Endangered or Threatened) and seven are included in the IUCN List. Seven more are included in Appendix II and one in Appendix I of CITES.

Eight **types of use** were identified (food, fuel, animal feed, industrial, construction material, medicinal, melliferous and ornamental) for 162 species of the flora surveyed within the study area. A detailed list of all species with their corresponding uses is found in the [Vegetation and Flora](#).

Regarding threatened species, of the total of registered species, 33 present some category of threat, 18 in Resolution 470/19, categorized as Endangered or Threatened with Extinction, 11 are in Appendix II of CITES and one in Appendix I, and 7 in the IUCN List (Vegetation and Flora Annex).

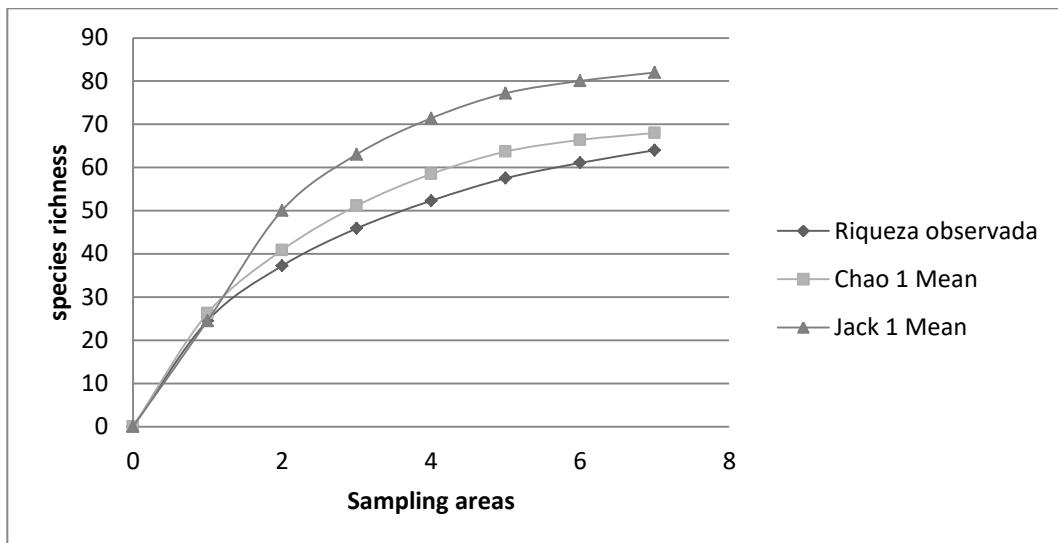

3.5. Ichthyological survey

The 81 species that make up the ichthyofauna surveyed represent 26% of the ichthyofauna in Paraguay, according to the Koerber, Vera & Reis (2017) checklist, and are present in the photographic record in the ichthyological annex as well as the methodology used. In total, 27 Families distributed in 7 Orders were registered, being the Order CHARACIFORMES with 10 Families the one with the greatest richness, within which Characidae (*Mojarras*) is the Family with the highest number of species recorded (23 species). Regarding abundance, the predominant fish is *Corydoras aeneus* with 1088 (24.41%) specimens for the four sites (properties), followed by *Odontostilbe pequira* with 702 (15.75%), *Aphyocharax anisitsi* with 200 (4.49 %) and *Hyphessobrycon eques* with 198 (4.44%); there are 13 species for which only one individual was captured in the entire monitoring. The Characidae family is the richest with 23 species (See [List of species with common names in Spanish, Guarani and English](#)). Regarding threatened species, *Potamorrhaphis eigenmanni* (Needle fish) categorized as VU (Vulnerable) according to MADES Resolution 1563/09 and *Odontostilbe pequira* (mojarra) is categorized by IUCN at the regional level as LC (Least Concern) . The AM Santa Teresa was the one with the highest richness (See [Absolute and relative abundance of fish](#)) with 41 species, and San Liberato AM with the least richness (13). The mojarra *Odontostilbe pequira* was the only species present in each of the ranches, while *Corydoras aeneus* is the most abundant species. A total of 10 species (20%) is used in subsistence fishing, 7% in commercial fishing and 23 species are for ornamental uses. Fish of the family Heptapteridae (catfish) are probably traditionally the most sought after in subsistence fisheries.

During the rainy season survey, 64 species were found, the most abundant species was *Odontostilbe pequira* (Mojarrita). In the campaign corresponding to the dry season, 62 species were identified, of which 17 were new, the most abundant species was *Corydoras aeneus*, this species had great dominance in several AMs (see [Abundance of total fish species per sampling area](#)), in this campaign two new groups were recorded, corresponding to the Order of MYLIOBATIFORMES, which are the freshwater stingrays and SYNBRANCHIFORMES, commonly called "eels".

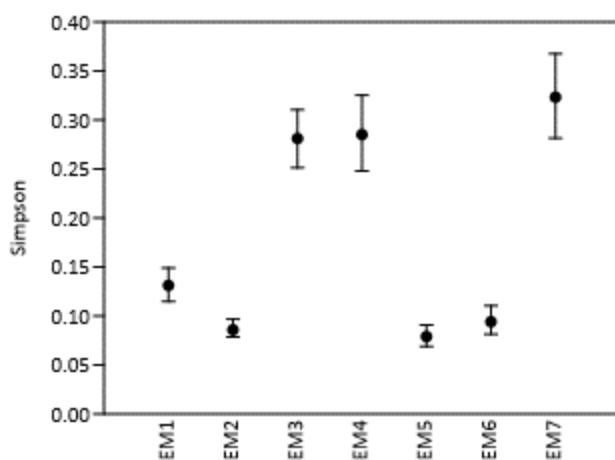

In terms of abundance, *Odontostilbe pequira* is the most frequent fish species in the seven sampling areas (properties) with 470 (26.14%) individuals, followed by *Corydoras aeneus* (153- 8.5%) y *Moenkhausia dichroura* (108 – 6%). There are eight species for which only one individual was captured during the entire monitoring. The 64 species of ichthyofauna recorded represent 21% of the Paraguayan ichthyofauna, according to the checklist of Koerber, Vera & Reis (2017), and together with the methodology used, have been included in the photographic record found in the [Ichthyology \(fish\)](#) annex.

The Characidae family is the richest with 18 species ([Ichthyology \(fish\)](#) annex). With regard to threatened species, it can be mentioned that *Potamorrhaphis eigenmanni* is VU (Vulnerable) according to MADES Resolution 1563/09 and *Odontostilbe pequira* (mojarra) is categorized by IUCN as LC (Least Concern) at a regional level. Santa Teresa sampling area held the highest richness (see [List of species by sampling areas](#) with 32 species, while the San Liberato sampling area/site presented the lowest richness with only 10 species. The mojarra *Moenkhausia dichroura* was the only species to be present at all of the ranches, while *Odontostilbe pequira* is the most abundant species. Ten species (20%) are used for subsistence fishing, while seven are used in commercial fishing and 18 are used for ornamental purposes (see [Usage of recorded species in different fishing practices](#)) likely that fish from the Heptapteridae family (catfish) could typically be considered the most desirable species in terms of subsistence fishing.

Figure 3-8 Species accumulation curve

EM1= Gavilán; EM2= Trementina; EM3= Soledad; EM4= San Liberato; EM5= Santa Teresa; EM6= Zapallo; EM7= Hermosa.

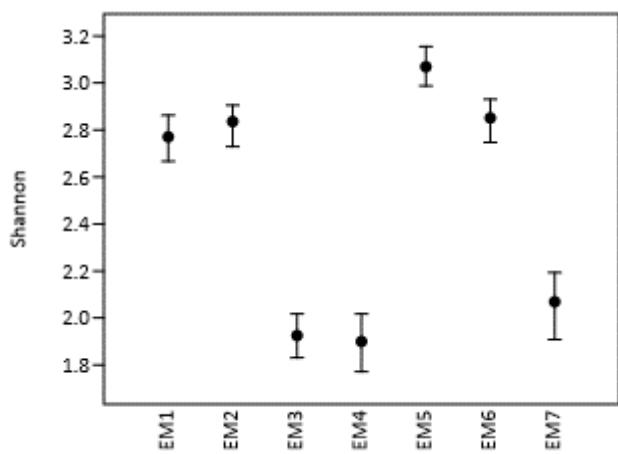

Based on the 81 species, it is estimated that approximately 95 species (95% confidence limits: 84.86 - 132.31 species) could be recorded in the area, with the same sampling effort (Chao1). However, the species accumulation curve obtained through the Chao1 and Jack1 estimators (Colwell 2009) shows that species with greater sampling effort will still be found because the curve (Figure 3-8) does not reach a plateau. According to these estimators, between 80.42% and 85.19% of the expected species were observed.

Figure 3-9 Simpson's Dominance

EM1= Gavilán; EM2= Trementina; EM3= Soledad; EM4= San Liberato; EM5= Santa Teresa; EM6= Zapallo; EM7= Hermosa.

The Simpson index represents the probability that two individuals, within a habitat, selected at random, belong to the same species. In other words, the closer the value of this index is to unity, there is a greater possibility of dominance of a species and a population; and the closer the value of this index is to zero, the greater is the biodiversity of a habitat (Magurran, 1988). According to this index, the dominance fluctuates between 0.07902 (EM7) and 0.3233 (EM2) (Figure 3-9).

Final report.

Figure 3-10 Equity Index (Shannon-Wieber)

EM1= Gavilán; EM2= Trementina; EM3= Soledad; EM4= San Liberato; EM5= Santa Teresa; EM6= Zapallo; EM7= Hermosa.

The Shannon index (Figure 3-10) expresses the uniformity of the importance values across all the species in the sample; and it measures the average degree of uncertainty in predicting to which species an individual chosen at random from a collection belongs (Magurran, 1988; Peet, 1974; Baev and Penev, 1995). It assumes that individuals are randomly selected and that all species are present in the sample. It acquires values between zero, when there is only one species, and the natural logarithm of S ($S = 4,394$), when all species are represented by the same number of individuals (Magurran, 1988). In this f monitoring, the values fluctuate between 1.9 (EM4) and 3,069 (EM2).

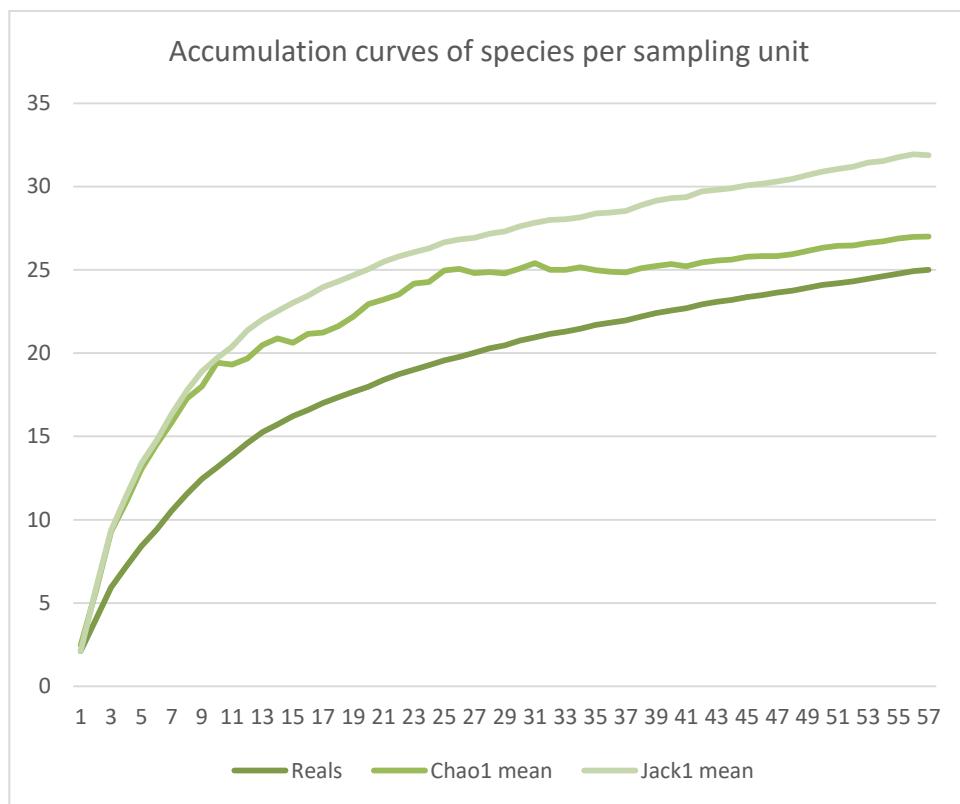

3.6. Herpetological survey

In both campaign, rainy and dry season, a total of 59 species (33 amphibians and 26 reptiles) were recorded and this represents 13 families (4 of amphibians and 9 of reptiles) (See [List of amphibians and reptiles recorded](#) for the complete lists of species). During the rainy season, a total of 31 species (24 amphibians and 7 reptiles) were recorded along the transects, while another nine amphibians and 14 reptile species were recorded during random searches and at breeding grounds in the entire study area ([Herpetology](#) see complete list of species this annex). This represents 61% of the amphibian species and 23% of the reptile species within the Concepción and Amambay Departments, combined (Brusquetti & Lavilla 2006, Brusquetti et al. 2007, Cacciali et al. 2016, Cacciali & Kohler 2018, Smith et al. 2012, Weiler et al. 2013). It is expected that the occurrence of at least another one amphibian species and twelve more reptile species is highly likely (Figure 3-11), based on the fact that these had already been observed during the evaluations of nearby conservation units, such as the Paso Bravo National Park (Altervida 2003), San Luis National Park (Rojas-Bonzi et al. 2020), Tagatiya Mi Nature Reserve (Concepción et al. 2004), and the Estancia Estrella Ranch (*Red Paraguaya de Conservación en Tierras Privadas*, 2008).

In the dry season, 24 species (16 of amphibians and 8 of reptiles) were recorded in the transects, plus 3 species of amphibians and 6 of reptiles in occasional sightings, for a total of 31 species (19 of amphibians and 12 of reptiles). These figures represent a lower number of species found compared to the rainy season, where 14 species of amphibians and 9 more reptiles were recorded.

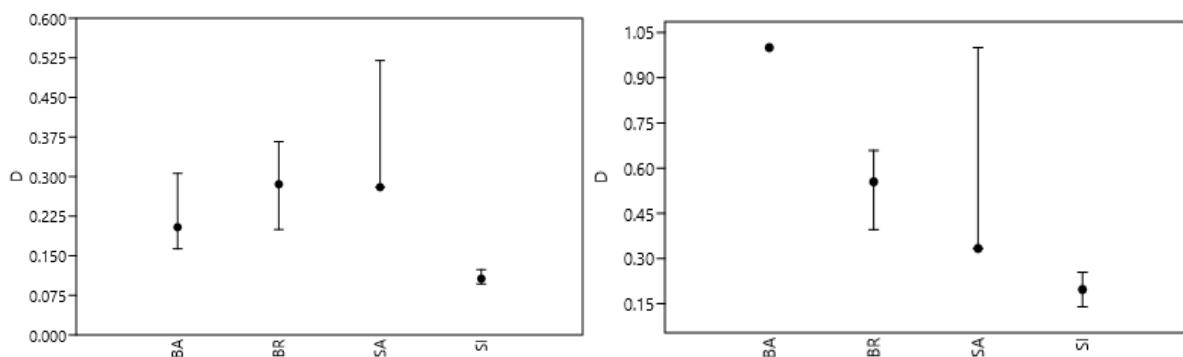

No new species of amphibian was recorded, but two species of snakes were added to the general list, these are *Palusophis bifossatus* and *Erythrolamprus typhlus* and three lizards, *Tropidurus torquatus*, *Stenocercus caducus* and *Colobosaura modesta*.

Figure 3-11 Species accumulation curve for amphibians based on each sampling unit (transects with repetitions)

Using the data obtained in the herpetological survey in both seasons, the Chao 1 and Jack 1 species richness estimators calculate that 27 species (95% confidence limits: 25.28 – 39.34 species, (Figure 3-11) could be found with the same sampling effort. As the curve does not reach asymptotes in the species accumulation curves, it is suggested that with a greater sampling effort, even more species not previously registered will be found. According to the estimators, between 92.59% and 78.41% of the species likely to occur in the area were observed.

Figure 3-12 Simpson Dominance in rainy and dry seasons

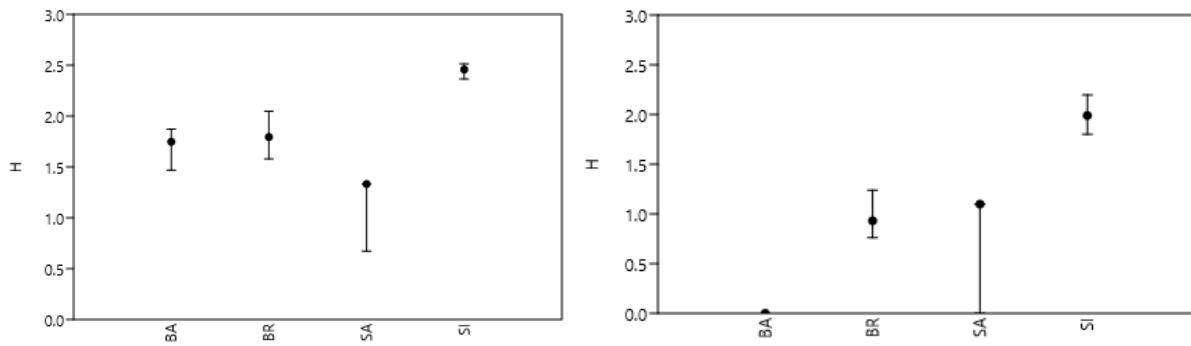

BA: Degraded High Forest; BR: Riparian Forest; SA: High Savanna; SI: Floodable Savanna.

Final report.

Biodiversity Baseline Study of Paracel Properties. Paracel S.A.
May 2021.

The Simpson index representing the probability that two individuals in a population are randomly selected and belong to the same species, expresses how equitable the number of individuals of the species found is (Magurran, 1988). The closer to 1 (one) the index is, the greater the dominance of common species, and the closer to 0 (zero), the more equitable the population. During the rainy season, in the BA, BR, SA and SI formations a mean dominance can be observed that fluctuates between 0.28 (BR) to 0.11 (SI) (Figure 3–12), which expresses high equality between species and low rates of rare species encounters, particularly in the SI, where low confidence intervals are observed and a mean close to 0. BA and BR have higher values, which indicates the presence of some species that are more abundant in the landscape. In the dry season, however, higher values are observed in general, with less equitable species in all formations. Similarly, SI was the one that remained with the lowest values in relation to the other formations. BA remains at 1 because only *Elachistocleis matogrossensis* was found in this formation.

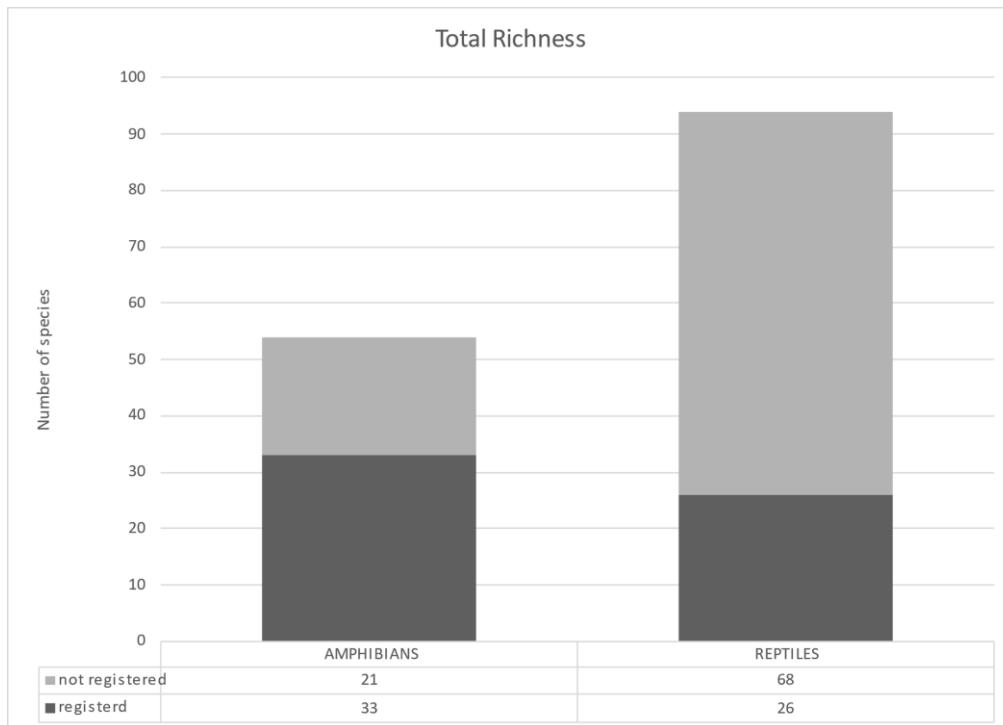

Figure 3-13 Equity Index

BA: Degraded High Forest; BR: Riparian Forest; SA: High Savanna; SI: Floodable Savanna.

On the other hand, the Shannon index expresses the uncertainty to predict to which species an individual found at random from a sample in the population will belong. The index has a value of 0 (zero) when the population sample contains only one species, and has maximum values when all the species assumed to be present are equitably represented (Magurran, 1988). In this case, the index varies between 1.3 (SA) and 2.4 (SI) (Figure 3–13) in the rainy season. This complements the Simpson index, which shows little equity in the representation of species, particularly high in SI and low in SA. For the dry season, this index also reinforces that of dominance from Simpson's.

Figure 3-14 Number of species listed for the departments: not recorded during fieldwork, recorded during fieldwork, possibly present (recorded during REA of nearby conservation units)

The amphibians recorded are all anurans (frogs and toads). The most numerous families during the rainy season in terms of species are Leptodactylidae (jumping land frogs) and Hylidae (tree frogs), both with 13 and 15 species each; followed by Bufonidae (toads) and Microhylidae (small-mouthed frogs). The most numerous genus was *Leptodactylus* (Leptodactylidae) with six species, followed by *Scinax* (Hylidae) with four species. The only family without representation that might be present is Odontophrynididae.

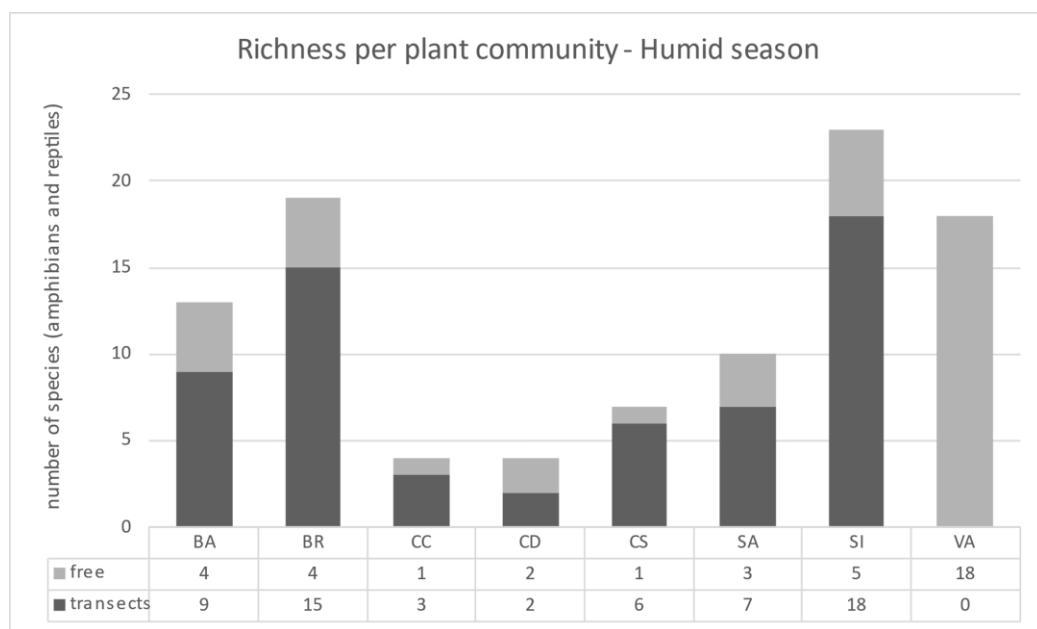

In the dry season, the Leptodactylidae and Hylidae families were also more numerous with 6 and 8 species, respectively. The Bufonidae are represented by 3 species and the Microhylidae by one. The most numerous genera were also *Leptodactylus* (family Leptodactylidae) and *Dendropsophus* (Family Hylidae), both with 4 species.

Reptiles, on the other hand, were represented by eight families in the rainy season, of which the most numerous was Dipsadidae (non-venomous snakes) with eight species, followed by lizards of the Tropiduridae family with four species. The rest were represented by only one or two species each, but from very diverse groups such as turtles, caimans, and both groups of venomous snake families: Elapidae (corals) and Viperidae (pit vipers and rattlesnakes). The most abundant group, with many individuals seen randomly throughout the entire campaign, was the Teiidae. *Teius teyou* was the most frequently seen species, with several individuals seen crossing paths during the main hours of activity.

Fewer reptiles were seen in the dry season, probably due to the unfavorable climate. They were also represented by 9 families, with the most specious as Teiidae with 4 species, followed by alligators. Unlike the rainy season, only three snakes were found, two snakes (one from the Dipsadidae family and another Colubridae) and one viper (Viperidae family). Again, the most active species in the dry season was *Teius teyou*, which was recorded in transects and in less quantity in free observations.

The three communities with highest richness of herpetozoa during the rainy season were SI (25 species), BR (19 species) and BA (13 species). Amphibians contributed most of the species to these results with 22 species in SI, 14 species in BR, and 9 species in BA (see Figure 3-15). Another element that harbors a high richness is the Aquatic and Marsh Vegetation (VA) which, although it was not strictly included in the systematic sampling, is occasionally found immersed within the SIs, but mainly in permanent and temporary water bodies of lotic and lentic systems. Through nocturnal samplings in cutwaters, wetlands, ponds and lagoons, it was possible to verify in the associated VA (See [Transects and their plant communities \(formations\). SECA = stands for transects developed during the dry season](#)) the presence of 15 species of amphibians and 3 of reptiles, which use this substrate as reproductive call sites (e.g.. *Dendropsophus nanus*, *D. minutus*, *Boana punctata*, *Scinax fuscomarginatus*), feeding (e.g. *Leptodactylus podicipinus*, *Leptodactylus macrosternum*, *Helicops leopardinus*) and / or refuge (e.g. *Caiman yacare*, *Caiman latirostris*).

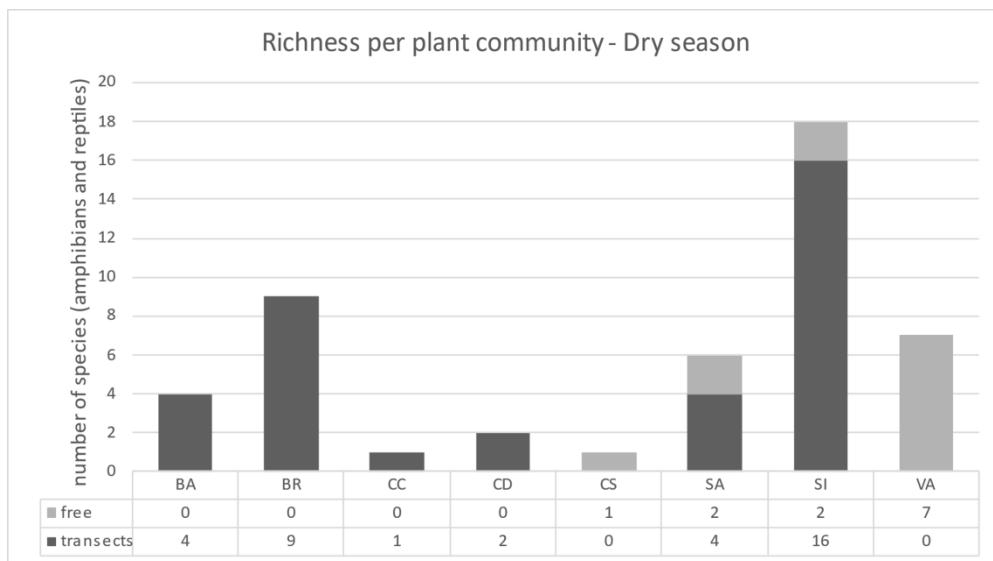

Figure 3-15 Number of species recorded under the various plant communities. Number of species found along transects and contribution from random surveys (by night, casual encounters)

Auditory records of 16 species using the SI as a breeding/mating ground during the rainy season were made based on vocalizations, which also resulted in the highest number of species vocalizing in any of the plant communities. In spite of this, surprisingly only five species of reptiles in this season were observed at this site: two of the three most recorded lizards (*Teius teyou* and *Notomabuya frenata*) and two snakes with single records (*Oxyrhopus guibei* and *Philodryas olfersii*).

BR and BA follow the SI in terms of species richness; in these formations, several species of anurans carry out vital activities such as estivation, hibernation, foraging, shelter and dispersal, as well as reproductive activities in the case of certain species (Gibbons 2003). A clear example is *Rhinella scitula*, a species that completes its cycle within the BR, breeding/mating at the edges of streams (Caramaschi & Niemeyer 2003; Maragno & Souza 2011), or the case of the males of *Leptodactylus elenae* which were recorded vocalizing from within the forest. A similar richness and abundance pattern is observed during the dry season for SI and BR, however, this is occasion, the other plant formations resulted in very low numbers to inference (Figure 3-16)

Figure 3-16 Number of species recorded under the various plant communities. Number of species found along transects and contribution from random surveys (by night, casual encounters)

Out of all the amphibian species found during the rainy season, only *Leptodactylus bufonius* and *L. labyrinthicus* were found once, inactive and found hiding/sheltered. In the case of BR and BA, six and five species of reptiles were found, respectively. In the BR we can mention the records of *Chelonoidis carbonaria* (tortoise), a sheltered *Bothrops diporus*, and a *Micrurus frontalis* which was found being preyed upon by a *Salvator merianae*; proof of the trophic interaction between herpetozoans. Furthermore, this particular event was interesting, as this lizard has been recorded preying upon multiple reptile and amphibian species (Kasperovicz et al. 2015), but not this particular coral.

In the SI, the most frequently encountered species in the rainy season was *Leptodactylus fuscus* (representing 22.6% of the total number of individuals observed), a very common and abundant jumping/leaping land frog found near permanent or temporary bodies of water, and even in degraded and urban habitats (Cei 1980, Souza et al. 2014). Other common species include *Leptodactylus podicipinus* (18%), *Physalaemus albonotatus* (7.2%) and *Pseudopaludicola amheghini* (6.9%). In the dry season, however, the most abundant species were *Pseudopaludicola boliviiana* (34.5%) and *Scinax nasicus* (24%), followed by *Physalaemus albonotatus* and *Dendropsophus nanus* (6.89% in both cases).

During the sampling, *S. nasicus* and *D. nanus* were found using as refuges to bromeliads typical of higher vegetation patches in the SI, this behavior was previously observed by both species in the Pantanal (Moravec & Campos 2020), which indicates the importance of these plant formations for the conservation of anurans. In this formation, *Dendropsophus elianae* was found, a frog endemic to the Cerrado and nationally threatened, using tall herbaceous substrates in the pasture. Finally, a calcined shell of *Chelonoidis carbonaria*, a nationally threatened turtle species, was also observed. In the BR, the two most abundant species by a wide margin were the species of the genus *Pseudopaludicola*, *P. ameghini* and, *P. boliviiana* (50 % and 12.5%, respectively), followed by *Physalaemus albonotatus* (9.9%), and *Rhinella scitula* (4.5%). These first three species were observed in abundance in the understory, particularly those of the genus *Pseudopaludicola*, which, using the litter and their small sizes (approx. 1 cm long), are difficult to detect.

Final report.

Similar patterns were seen in BR of the Humid Chaco in the country (Moreno 2017), where in this case *P. albonotatus* and *P. boliviana* dominate the diversity of terrestrial anurans in the BR while *S. nasicus* the diversity of arboreal anurans, the arboreal species that was more abundant in this physiognomy. During the dry season the dominance of *P. boliviana* and *P. ameghini* (72% and 3.9%) and *P. albonotatus* (15.7%) was observed again, but species characteristic of this formation such as *R. scitula* and *A. diptyx* were only found by chance records outside the transects.

The encounter rates within other plant communities were too low to make any statement regarding relative abundance. Nevertheless, it is worth mentioning that during the rainy season four individuals of *Melanophryniscus fulvoguttatus* were observed (15%) in BA, making it the species (out of six) together with *P. albonotatus* with the highest number of encounters in this forest formation. Although observed in the forests, these small toads were detected calling/singing/vocalizing in tall herbaceous fields in the *Cerrado*, where temporary bodies of water form. During the dry season, *Colobosaura modesta* was found under a trunk, this is a terrestrial lizard associated to the Paraguayan Cerrado (Cacciali et al. 2016). In *Cerrado* phytophysionomies, *Teius teyou* was the most common, but with only four or fewer records for each formation. The diversity indices were applied only to the amphibian records, since the reptile encounters were very fortuitous and from very distant taxonomic groups. Both Shannon and Simpson indices show the same pattern ([Herpetology](#)) for both seasons, where SI and BR are more diverse with respect to BA. It is also observed that the SA has insufficient records to adjust the estimates to calculate reliable estimators. This is consistent with the results described above. Of the amphibian species listed, none have any value in terms of commercial use and are therefore not listed in CITES.

In terms of amphibian conservation status, only *Rhinella scitula* and *Dendropsophus elianae* are included under some degree of threat, both at international and national levels. *Rhinella scitula* is a small terrestrial toad (34 -51 mm) endemic to the *Cerrado*; in Paraguay it is found exclusively within the riparian forest in the Departments of Amambay, Concepción and San Pedro (Brusquetti et al. 2006, Smith et al. 2012, Sugai et al. 2014). *Dendropsophus elianae* (20 - 26 mm) is an endemic climbing frog of the *Cerrado* (Napoli & Caramaschi, 2000); it has few records in the country which all come from within the Departments of Amambay and Concepción. Its restricted distribution and few records rank it as EN (endangered) at a national level (Motte et al. 2019).

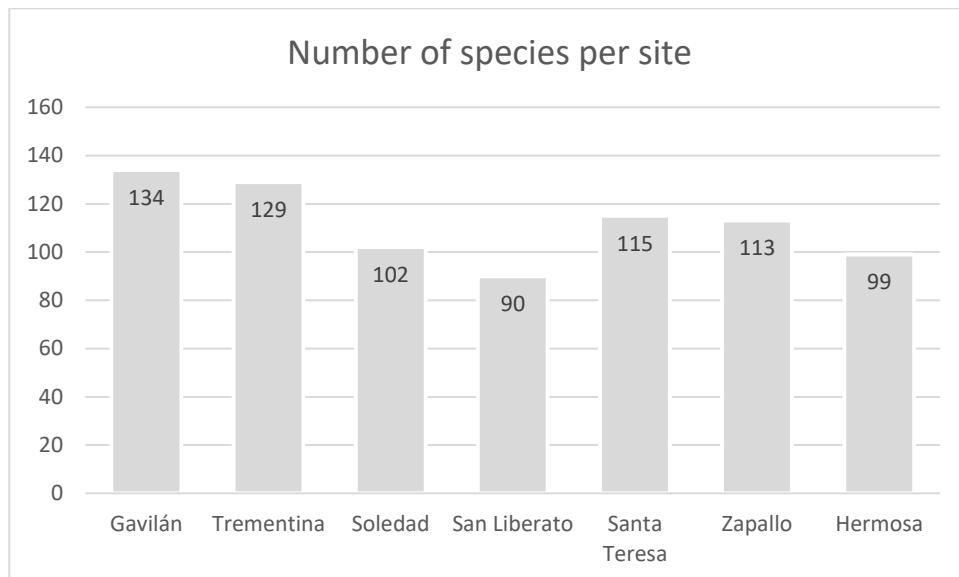

Of the reptile species recorded, none are included under any level of international threat category. At a national level, however, *Chelonoidis carbonaria* (red-footed tortoise), *Caiman latirostris* (broad-nosed caiman) and *Colobosaura modesta* are threatened (MADES Res. N°206) and two first ones listed in CITES. Among the species with a high probability of occurrence, *Eunectes notaeus* (*anaconda amarilla*) and *Boa constrictor* (*boa de las vizcacheras*) are listed in CITES; the latter, together with *Norops meridionalis* (*camaleoncito*), are threatened at a national level. *Chelonoidis carbonaria* is a large land turtle, with a widespread but fragmented distribution in South America, whose southern portion covers most of the Pantanal biomes, the northern portion of the Chaco and southern portion of the *Cerrado*. The only two records obtained in BR at the main course of the Trementina (22°37'54.1" S, 56°54'01.0" W), an area almost unaffected by anthropic activities, though locals affirm that it is also seen in more modified areas, and a calcined carapace at Zapallo SI (22°31'18.2" S, 56°36'42.0" W). Finally, *Colobosaura modesta* is a terrestrial lizard broadly ranging in Brazil and reaching Paraguay in the *Cerrado* and the Humid Chaco. This speies is considered endnagered due to its scarce presence.

At present, there are no legal commercial uses of reptiles in Paraguay (MADES – DGPCB 2019) though historically the local populations, immigrants and indigenous, have utilized wild species for subsistence, trade, pets, medicines and rituals (MADES – DGPCB, 2019), including reptiles such as boas, aquatic and terrestrial turtles e.g. *Chelonidis carbonaria*, both species of caimans and tegu lizards (*Salvator*). In the 80s and 90s, there were national programs for caiman (Aquino & Scott, 2008), boas (Waller et al., 1995), and tegu lizards (Mieres & Fitzgerald, 2006) harvesting mainly focused on their hides. None of these programs are any more valid and the trade of these species is illegal.

3.7. Ornithological survey

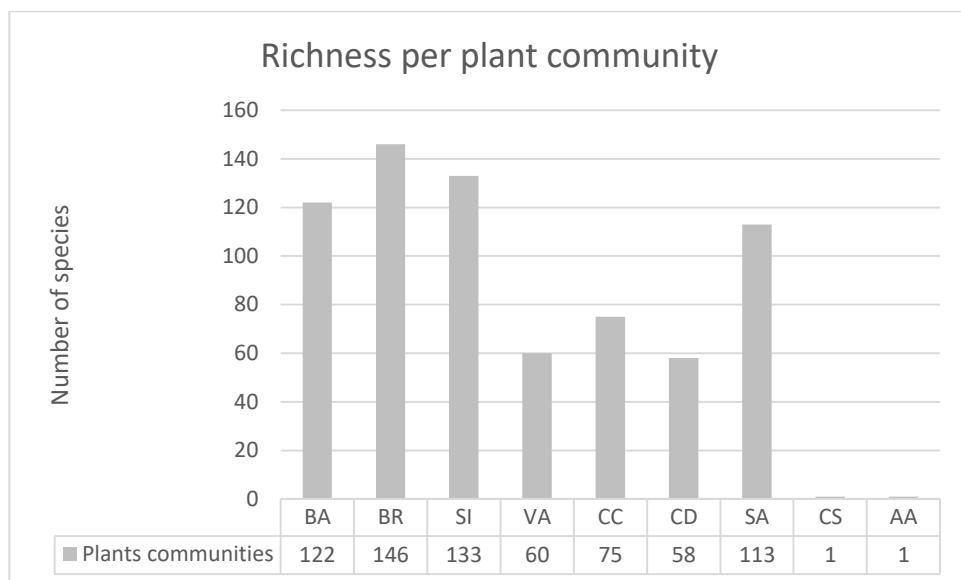

A total of 260 species of birds were recorded, belonging to 26 orders and 50 taxonomic families, including the Tyrannidae (15%), Thraupidae (11%), Furnariidae and Psittacidae (6%) families with most species recorded. The dominant species of the first most abundant family varied during the wet and dry seasons, being the most common during the first season: *Tyrannus melancholicus*, *Megarynchus pitangua*, *Myiarchus tyrannulus* and *Empidonax aurantioatriocristatus*, which by the shape of the beak hunt larger insects in flight , unlike the drier season, where the availability of various flying invertebrates is reduced, in addition, these birds carry out regional migrations, therefore, they are replaced by other residents and / or migrants from the south, registered in the winter campaign, which were: *Xolmis velata*, *Xolmis irupero*, *Xolmis cinereus*, *Hymenops perspicillatus*, *Myiarchus ferox*, among the most common. The increase in the number of registered species of the Trochilidae family stands out, compared to the summer campaign in the wet season, which, according to Oliveira and Marquis (2002), is probably a general phenomenon during the dry season since these species make a movement local towards gallery forests. In some cases, towards specific and fundamental plants in their habitats that bloom only for very limited periods and provide much-needed resources this season. The same authors mention that 90% of fruits available in the forest for consumption in forests and cerrados is due to parrots such as *Amazona* spp. and *Ara* spp., species that after eating part of these fruits, let them drop and are later consumed and dispersed by other birds or small mammals.

Among the sampling areas Gavilán and Trementina presented highest number of species recorded during field monitoring (60% and 58%, respectively), followed by Santa Teresa (52%) and Zapallo (51%). Soledad and Hermosa recorded the 46 and 44% of total species, while San Liberato was the site with the less recorded species (40%) (Figure 3–17). The difference in number of species recorded between the highest and lowest sampling areas was due to the fact that the travel to and from the other sampling areas was made from Gavilán, thus creating a greater opportunity to record occasional species, and this impacted on the total richness of these sites in particular, as well as due to the heterogeneity of natural communities present in each AM (see [Sampling avifauna in different natural communities in study area](#)).

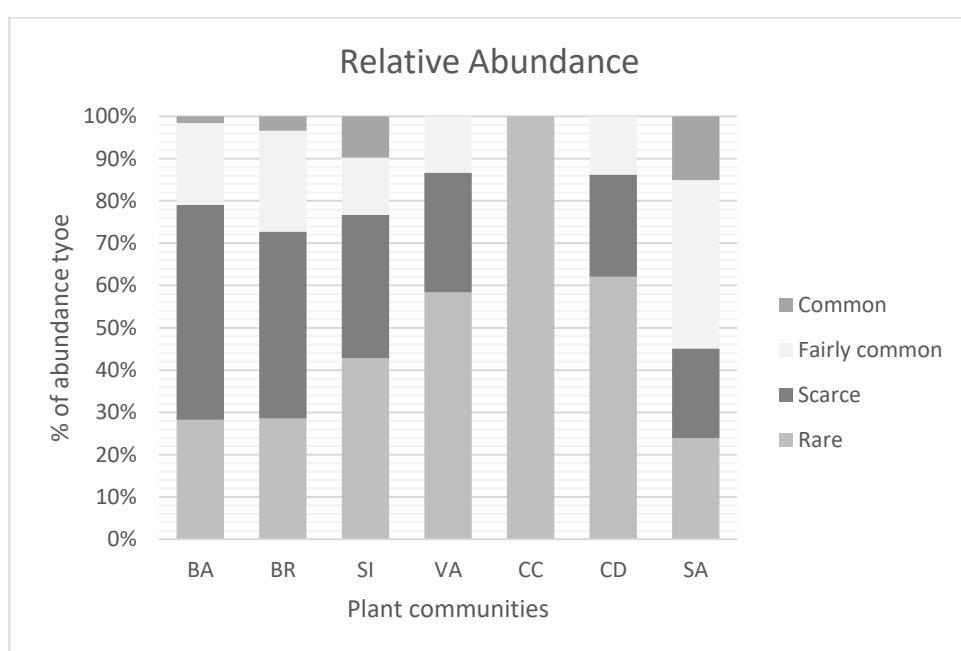

Figure 3-17 Richness of birdlife by sampling area

The natural community with the highest number of species was the BR (56%), bearing in mind it was surveyed in all properties; followed by SI (51%), BA (47%) and SA (43%) with 133, 122 and 113 species recorded in each, respectively. This distribution of records in the aforementioned communities, coincide with Tubelis et al. (2004), who suggest that the savannas adjacent to gallery forests could play an important role in the conservation of avifauna closely related to these forest formations, because, although gallery forests are relatively stable habitats in relation to seasonality, the savannas adjacent to these formations could be valuable sources of invertebrates and plant resources that compensate for the scarcity of food in the forests. Another important factor to evaluate in future samplings is the width and structure of the gallery forest vegetation, since part of the functionality and availability of resources depend on these factors when studying the bird community present in them, and also, it would comply with the provisions of Law No. 4241/2010 and its Regulatory Decree No. 9824/2012 "By which Law No. 4241/2010 for the reestablishment of protective forests of water channels within the national territory is regulated" (MAG 2012).

The phytophysionomies of the *Cerrado*, *Campo Cerrado* (CC) and *Cerradón* (CD) were the sites with the lowest number of recorded species (75 and 58, respectively) (Figure 3-18). The latter could be due to the fact that not all sites had typical plant formations of the *Cerrado* in a good state of conservation, and some of them were subject to fires during the monitoring, and were grazed by livestock. In VA 60 species were recorded and in CS and AA only each in each. In the natural communities of the BR, CC and SI, species under one or another category of national and international threat were found. Meanwhile, the species with migratory patterns were recorded, for the most part, in the BR (50%) and SI (30%) formations; the remaining 20% were distributed among the other communities.

Figure 3-18 Richness of birds by natural community type

With regard to the relative abundance evaluated within the 303 lists in all natural communities, a total of 4,674 individuals were recorded, with BR being the community with the most individuals counted (38%), followed by BA with 21%, SI (12%) and SA (10%) (Figure 3–19). Meanwhile, the formations with the lowest number of individuals were VA (5%), CC (8%) and CD (6%), respectively, which could be due to the fact that they have fewer lists compared to the other sites. In all the communities, the relative abundance of the species was considered rare, because they were only detected twice during all the surveys, with CC as the only community with this category of relative abundance, due to repetitions failed due to security reasons. . The other large part was scarce with more than two records, and to a lesser extent frequent and common (between three and nine records), with BA, B and SI being the sites with the most frequent species. Meanwhile, the SI and SA were the sites with the most common species (between 4 and 17 records), due to being detected on several occasions (Figure 3–19).

Figure 3-19 Relative abundance of the recorded bird species**Final report.**

Six species were recorded that fall under categories of threat at an international level (NT and VU), while eight species were recorded that fall under categories of threat at a national level (Threatened and Endangered) (see [Ornithology](#)) (MADES Resolution No. 254/19, Rojas et al. 2020, IUCN 2021). There were several records of a single endemic species to the *Cerrado*, *Saltatricula atricollis* (*pepitero de corbata*), at CC and SA in all sampling sites. In spite of being considered an endemic, this species is expanding to the south due to the savannization of landscapes in the eastern region of the country (see ornithological annex). Also, the record of *Alipiopsitta xanthops* (*loro cara amarilla*) another endemic species, recently documented for the country and with few records (Alvarez et al. 2012), are among the eleven species endemic to the Cerrado which occur in Paraguay according to Silva (1997). Three species endemic to the Alto Paraná Atlantic Forest, one of them nationally threatened (*Notharchus swainsonii*), and only one endemic to the Dry Chaco (*Ortalis canicollis*) (Guyra Paraguay 2004).

Forty-one species (16%) of the birds recorded are included in the CITES Appendices. All species of Psittacidae Family are included in Appendix II together with some species of Accipitridae, Falconidae and Thraupidae. Two species (*Pteroglossus castanotis* and *Sarcoramphus papa*) are included in Appendix III and *Jabiru mycteria* in Appendix I. This report includes the 59% of the psittacid species of Paraguay. This region is habitat for most of the parrot species of the country, one of the bird families with most pressure regarding illegal capture and trafficking for the pet trade, resulting in drastically reduced populations. It is for this reason that this information should be considered relevant when implementing protection and conservation strategies within the project area. Among the species of importance for conservation, *Alipiopsitta xanthops*, an endemic to the Cerrado and threatened with extinction at the local leveal and NT at global level; *Ara chloropterus*, one of the three species of Macaw that occur within our country, though this species is not threatened globally, it is considered Endangered at a national level (MADES Res. 254/19). This species is frequently observed and there are indications that it could be nesting within the area it was recorded, according to interviews carried out with the local population (See annex of [Ornithology](#)).

Information was gathered regarding *Anodorhynchus hyacinthinus* and *Ara ararauna*, two of the three species of macaw that occur in Paraguay. Both are considered Endangered at a national level; however, at an international level, the first species is ranked as Vulnerable (VU) while the latter species ranks under the category of Least Concern, according to the IUCN (2020). According to key informants, individuals of this species enter from Brazil to feed and descend towards the Serranía San Luis, which coincides with the frequent records from ranches near the northern edge of the Serranía San Luis National Park (Levatich & Padilla 2019, Rojas-Bonzi et al. 2020). The species was recorded nesting in some of the properties surrounding the park (Ea. Arrecife, Ea. Garay Kue as well as in San Luis de la Sierra (Rodríguez et al. 2019).

Species that have both, seasonal as well as regional migratory movements, were recorded and four states of occurrence were identified (Chart 3–1). Of the 260 species, 83% are BR, 8% are BN, four are AM and 3% BS. *Tringa solitaria* and *Falco peregrinus* are NM. Only one IB species (*Passer domesticus*) was recorded (See annex of [Ornithology](#)).

Chart 3–1 State of occurrence of the birds recorded in the area

State of occurrence		
BR	Breeding Resident	Permanent breeding resident
BN	Breeding Migrant to the North	Species that breeds in Paraguay, but is less abundant or absent during winter
BS	Breeding Migrant to the South	Species that breeds in Paraguay, but is more abundant or absent during winter
NM	Nearctic Migrant	Nests in North America during the northern summer and then migrates south during the southern spring and fall.
IB	Introduced	Introduced permanent breeding resident.
V	Vagrant, nomadic	Species with an occurrence pattern unclear in Paraguay, no nesting but of occasional presence.

Source: Adapted from Guyra Paraguay (2004).

Another noteworthy species was *Pipile cumanensis*, which according to del Hoyo et al. (2019), has a distribution that ranges across the south of Venezuela, Guyana, northwestern Brazil and into the Amazon region of Colombia, Peru and Ecuador, thus leaving the subspecies *Pipile cumanensis grayi* as a species that occurs in Paraguay. In this sense, the IUCN follows the same nomenclature for its Red List but the change has not yet been accepted by the South American Classification Committee (SACC, Remsen et al. 2020). Consequently, it continues to remain as *P. cumanensis* for the country, but maintains the threat category assigned by the IUCN for *P. grayi*. It is also threatened with extinction (AE) at a national level. Records of this species in the country are distributed within the northeast of the Western region and in the departments of Amambay and Concepción. The other species of this family was *Crax fasciolata*, which is locally threatened with extinction (AE) and vulnerable (VU) at an international level. These species of the Cracidae family are more associated with BR, but can also occur in several forest communities of the *Cerrado* (BC) (MADES Resolution N°254/19, Rojas-Bonzi et al. 2020, IUCN 2021) (See annex of **Ornithology**).

Among the birds registered during the first sampling campaign, the species indicated as "hunting for self-consumption" that were found in the forest formations (*Crax fasciolata*, *Pipile cumanensis*, *Crypturellus* spp. and *Patagioenas picazuro*) are listed. Meanwhile, in grassland environments tinamous (*Rhynchotus rufescens* and *Nothura maculosa*) are listed, and in natural aquatic communities, mainly ducks (*Cairina moschata*, *Dendrocygna viduata* and *Amazonetta brasiliensis*). According to the interviews carried out with the local inhabitants, their reports coincide with Morales and Zarza (2007), where they mention that subsistence hunting is widely extended in Paraguayan territory. Meanwhile, the parrots (parrots, macaws and parrots) are the main family affected by the illegal trafficking and trade of wildlife destined for pets in Paraguay (Mendoza et al. 2015). Morales and Zarza (2007) mention that there are other uses of birdlife due to their "medicinal or ornamental properties, but whose practice is exclusively limited to indigenous groups associated with forests. Among the species known for these uses were recorded, in this survey campaign: *Rhea americana* and birds of the families Tinamidae, Columbidae, Cathartidae, Corvidae and Turdidae.

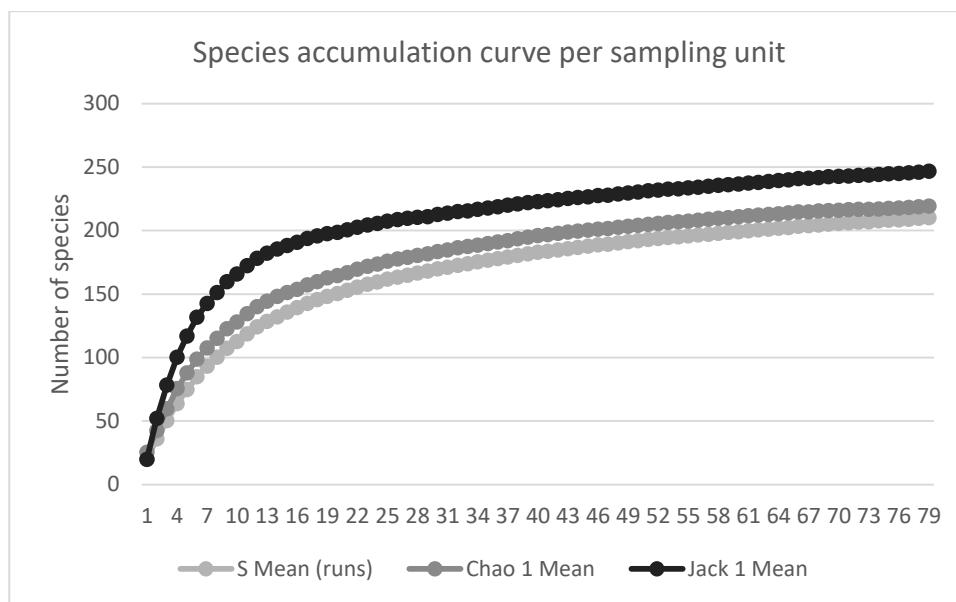

Final report.

Biodiversity Baseline Study of Paracel Properties. Paracel S.A.
May 2021.

Based on the sampling effort carried out in the surveying days in the field that resulted in the registration of 260 species of birds, through 72 transects of 150 m, added the occasional species, totaling the survey in 303 lists generated in the transects during the morning and the afternoon in the different natural communities, the accumulation curve indicates that the effort is representative, since the curve tends to be asymptotic (Figure 3–20). This indicates that the number of new species that could be registered in the area is decreasing, or, in other words, a large part of the species present in the selected sampling sites were registered.

The Chao 1 estimator indicates that nine more species could be added to the 210 recorded in the transects established in the different plant communities. On the other hand, the Jack 1 estimator indicates 247 expected species as the maximum number (Collwell 2009). This last number almost coincides with the total number of species recorded inside and outside the transects in all the sampling units evaluated during the sampling campaigns (260 species).

Figure 3-20 Species accumulation curve for birds recorded in the field campaing in Paracel Properti

The Simpson index value was 0.988 (maximum value 1), which indicates a high probability that two individuals of different species are registered, therefore the sites sampled during the campaigns present a high diversity, taking into account the sampling effort made.

The value of the Shannon-Wiener index obtained was 4.8, being the maximum value estimated for the sampling data of 5.2, which indicates that the species were uniformly represented, considering all the sampled species which could indicate that the diversity of birds is high in the sites sampled.

3.8. Mammalian survey

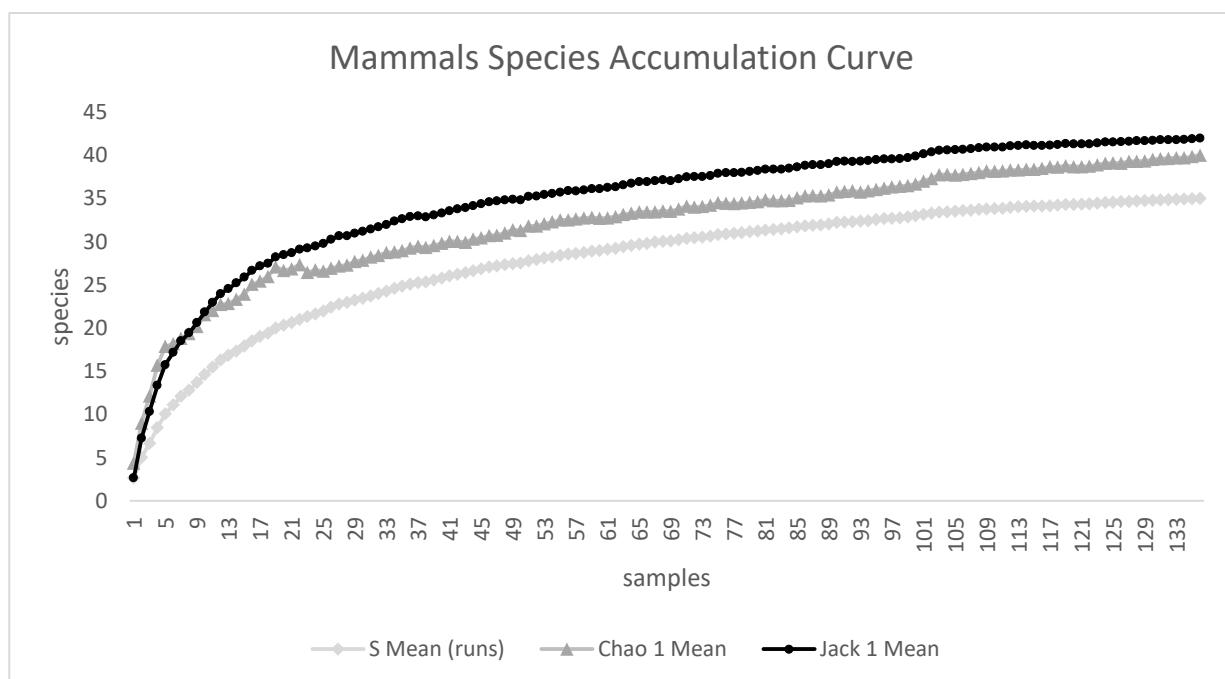

A total of 63 mammal species were recorded, 38 corresponding to 10 orders and 20 families in a first instance and later with a special effort focused on bats, 25 species were added (See detailed information in [Mammalogy](#)). This represents 31% of the species, 100% of the orders and 50% of the families present in Paraguay; it also represents 35% of the species listed as possible. Furthermore, signs of at least three taxa found that could not be identified at species level, as well as two rodents were recorded on camera traps whose identification remains totaling at least five unidentified species.

This indicates that 42 mammal species are recorded directly or indirectly during this survey. The following analysis is referred to the general surveys of mammals developed in first instance and followed by a deeper based on the survey and findings of bat monitoring.

A total of 35 species were recorded directly with the systematic sampling, included the species undetermined what represents 83% of the 43 taxa recorded. On the other hand, eight species were recorded indirectly, among them species elusive species such as *Ozotoceros bezoarticus* (Pampas Deer) and *Chrysocyon brachyurus* (Maned wolf), and species of importance for conservation such as *Panthera onca* (jaguar).

The species accumulation curve generated by sampling with camera traps and linear transects (Figure 3-21) indicates that the survey tends towards an asymptote, but that the richness will continue to increase with greater sampling effort. Using only direct records, the Chao 1 richness estimator presents a mean value of 39.9 (95% CI: 34.6 - 52.8), while the Jackknife 1 estimator presents a mean value of 41.9. According to these estimators, during the survey between 83.4% (Jack 1) and 88% (Chao 1) of the species that could be recorded with the same sampling effort were recorded.

Figure 3-21 Species accumulation curve for mammals and richness estimators per sampling unit

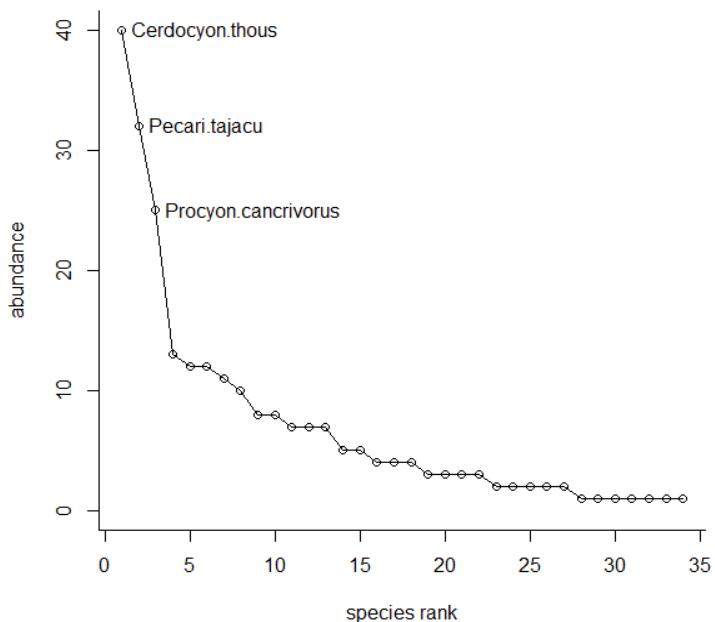

Of all the mammals recorded, the order Carnivora is the best represented with a total of five families and 13 species; the Felidae family has the most species (5). The order Rodentia is the second best represented, with a total of five families and seven species recorded. Furthermore, 100% of the representatives of the families Myrmecophagidae, Leporidae, Procyonidae, Tapiridae, Dasyprotidae and Cuniculidae in Paraguay were recorded during this survey.

On the basis of direct records, *Cerdocyon thous* (zorro de monte) is the most abundant species observed, followed by *Pecari tajacu* (collared peccary) and *Procyon cancrivorus* (osito lavador) (Figure 3-22). Other frequently occurring species include *Tapirus terrestris* (tapir), *Dasyprocta novemcinctus* (mulita grande), *Sylvilagus brasiliensis* (conejito de monte) and *Hydrochoerus hydrochaeris* (capybara).

Final report.

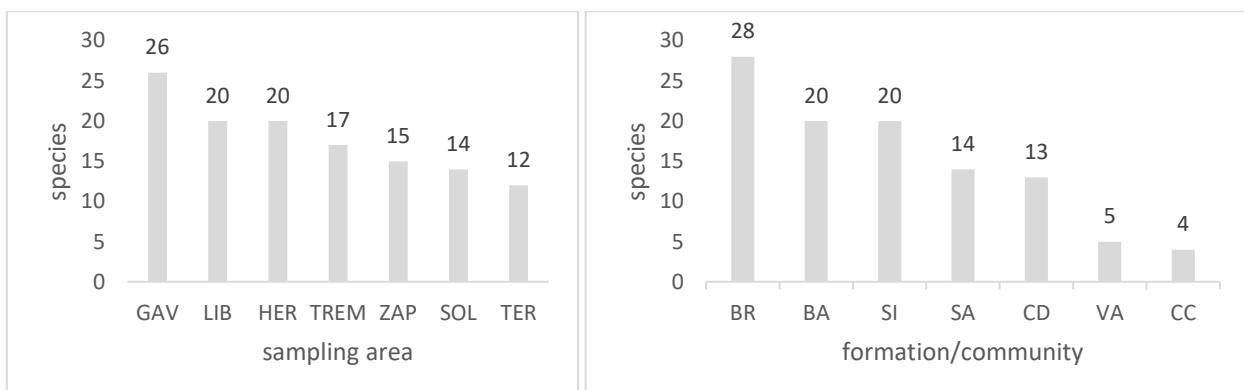

Records of deer (*Mazama gouazoubira* and *M. americana*) are also quite frequent; however, most of the tracks are not attributable to any one of the two species (Angeli et al. 2014) due to the variability in size of the individuals, making it difficult to determine their specific abundance. On the other hand, *Desmodus rotundus* and *Platyrrhinus lineatus* (bats), *Cavia aperea* (cuis), *Sapajus cay* (capuchin monkey), *Leopardus braccatus* (pantanal cat), *Leopardus pardalis* (ocelot) and *Coendou prehensilis* (large porcupine) were the species with the least direct records made.

Figure 3-22 Rank-abundance curve for the mammal community recorded during sampling

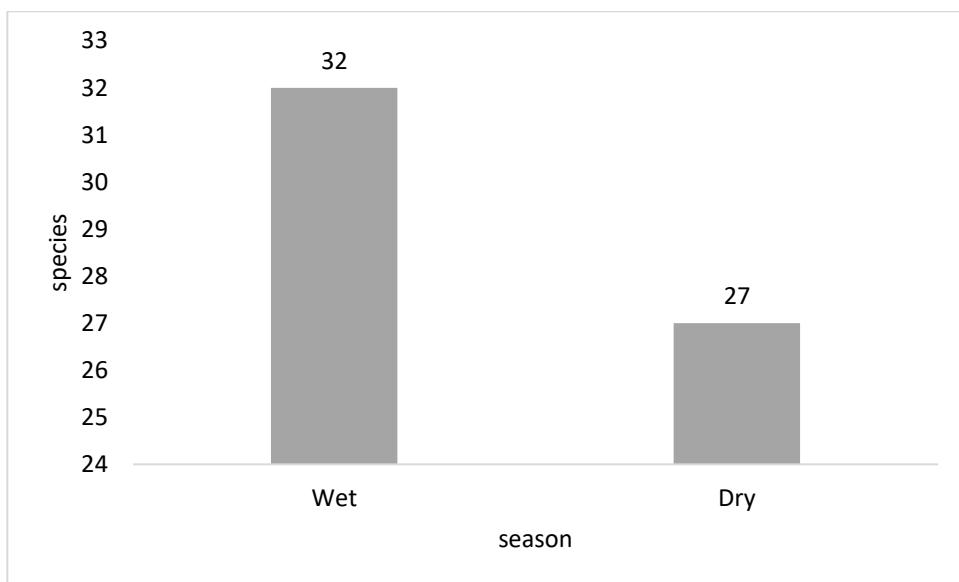

The observed species richness varied according to the sampling areas and the natural communities sampled (Figure 3–23). Among the AM, Gavilán is the one with the highest species richness with 70% of the registered species. On the other hand, among the natural communities, the BR is the one with the greatest wealth observed with a considerable difference with the wealth observed in other natural communities. It is worth mentioning that the CS community was not included in the figure because there were no traces attributable to any species; however, trails and burrows were observed in this community. In relation to seasonality, richness was higher in the humid (summer/rainy) season (Figure 3–24).

Figure 3-23 Observed richness by sampling area (AM) and natural community

Final report.

Figure 3-24 Number of mammal species in rainy and dry seasons.

The structure of the mammalian communities presented variations in the different plant communities. It was observed that the crab-eating fox is the dominant species in terms of abundance in three of the four analyzed plant communities (BR, SI and SA), while the collared peccary is the dominant species in the BA formation, in the one with the fox in second place. It should be noted that two armadillos presented high abundances in the SA community.

Table 3-2 Shannon and Simpon Indexes for mammals per plant community

Indicator (mean)	Plant community				
	All	BA	BR	SA	SI
Taxa/Richness (S)	35	22	27	14	18
Individuals	463	44	83	37	46
Simpson (1-D)	0.91	0.897	0.93	0.88	0.898
Shannon (H)	2.87	2.54	2.93	2.38	2.55

According to the estimated values of the Shannon (H) and Simpson (1-D) indexes for the different plant communities, the uncertainty in predicting a species taken at random in the sample is measured, so it increases as it increases. The representativeness of the species in the sample, that is, it increases with diversity (Magurran, 2004). The Simpson index (D) is a measure of the dominance that a few species present in the analyzed community, that is, the calculated value decreases as diversity increases; For this reason, it is intuitive to use the complement of this index, or the Simpson diversity index (1-D), which is a measure of the degree of equity between the species present in the community (Magurran, 2004). According to the values calculated here, the plant community with the greatest diversity of mammals is the BR.

Final report.

Biodiversity Baseline Study of Paracel Properties. Paracel S.A.
May 2021.

Regarding species of importance for conservation and of scientific interest, we can highlight the records of *Panthera onca* (jaguar), Near Threatened (NT) internationally and Critically Endangered (CR) in Paraguay, as well as *Chrysocyon brachyurus* (maned wolf), NT under the IUCN and Vulnerable (VU) at the national level. Both species have been recorded indirectly based on the reliable testimonies from local people. Other records of interest include *Leopardus braccatus* (*gato del pajonal*), NT under the IUCN and Data Deficient (DD) at a national level; *Leopardus pardalis* (ocelot), NT in Paraguay; and *Myrmecophaga tridactyla* (giant anteater), *Tapirus terrestris* (tapir) and *Tayassu pecari* (white-lipped peccary), these last three being VU both at national and international levels. Among all the species recorded, eight fall under some category of national or international threat, two are considered DD (lacking data for evaluation) at the international level and two at the national level, while one species (*Sylvilagus brasiliensis*) is not evaluated due to recent changes in its taxonomy. Furthermore, 18 of the recorded species are found in one or another of the CITES appendices.

Regarding the specialized sampling of bats, a total of 26 species were registered; six species by direct method (mist nets), one species by occasional record (*Platyrrhinus lineatus*, in the AM Zapallo), 17 species by the acoustic method and with both methods two species ([Richness by species in sampling sites](#) See Table). The five species common to all the sampling areas were *Lasiurus ega* and *Lasiurus blossevillii* of the family Vespertilionidae; *Molossus rufus*, *Nyctinomops laticaudatus* and *Eumops* sp. of the family Molossidae, all belonging to the insectivorous guild. Seven species were only recorded at one site: *Artibeus lituratus* (AM Soledad) and *Platyrrhinus lineatus* (AM Zapallo), both frugivorous species; *Glossophaga soricina* (AM San Liberato) nectarivorous species; *Nyctinomops macrotis*, *Cynomops planirostris* and *Molossus* sp. (AM Turpentine) an insectivorous species and *Noctilio leporinus* (AM Hermosa), an ichthyophagous (see [Bat community](#)). The sampling effort carried out in the direct method following the calculation methodology of Straube & Bianconi (2002) was 18,900m²h. The acoustic record generated through the SM4BAT and the Echo Meter Touch Pro 2, 77 and 4.7 hours of recording, adding 8,102 and 1,136 records, respectively. Both methodologies are necessary for bat monitoring, since, as mentioned above, insectivorous groups are less likely to be captured in mist nets, unlike frugivorous species that, due to the type of flight, can be captured more easily with mist nets. Both methodologies have been successfully implemented in collecting species data (Pech-Canche et al., 2010; Delgado-Jaramillo et al., 2011; Zamora-Gutierrez et al., 2016).

With the implementation of the two methodologies for monitoring of chiropterofauna, 75.75% of the total species described for the area were recorded (33). Two species of those recorded by the bioacoustics method are found with Vulnerable Conservation Status (VU) and Data Insufficient (DD) at the country level, *Peropteryx macrotis* and *Saccopteryx leptura*, respectively. There are no official records of *Saccopteryx leptura* in the area, and the collection of the specimen would be required to obtain a control material of the species in situ; however, the probability of the presence of this species in the area is very high and should be taken into account in future research. In relation to the abundance and richness of species, it was estimated, according to the Shannon diversity index, that Soledad AM (2.26), Trementina (2.18), and San Liberato (2.11) are the sites more diverse based on species equity (See Table in [Bat community](#)). The Shannon index coincides with the total of species registered in each site where the AM Trementina and Soledad contain the highest number of species (17), followed by AM San Liberato (16). These results also coincide with the presence of water bodies surrounded by native vegetation, considered characteristic habitats conducive to the presence of bats. Regarding the Simpson diversity index, it can be observed that in the Zapallo (0.47) and Hermosa AMs (0.58) they are among the most diverse.

This index also allows observing the estimation of dominance of each site, being AM Soledad (0.87) and San Liberato (0.85) the ones with the highest dominance of species. The estimation of the diversity indices helps to visualize the importance of each site and not just the number of registered species. It is observed that the estimators used (Chao2 and Jack1) contemplate that with a greater sampling, the estimated 32 species for the study area would be reached (see The Chiroptera community). In this way, a total of 26 species were recorded at the seven sampling points during the seven nights, corresponding to 81.25% of the species described for the area according to the estimators used.

3.9. Preliminary results with the eDNA analysis

NatureMetrics (2021)² has presented a preliminary result of the analysis of 115 samples collected. These sampled showed evidence for 357 taxa with an average taxonomic richness of 39.9 (4 to 90) with the most abundant sequence for *Pimelodella* sp., and the most commonly detected species being *Hoplias* sp. This analysis resulted in the identification of five species of conservation concern (NT - Near Threatened on the IUCN Red List). These five species were two bird species the Turquoise-fronted Amazon (*Amazona aestiva*) and the Greater Rhea (*Rhea americana*) and three mammal species, the Neotropical Otter (*Lontra longicaudis*), the Naked-tailed Armadillo (*Cabassous chacoensis*), and the Black-and-gold Howler Monkey (*Alouatta caraya*). These are the species mentioned in the report while it is referred that 39.5% (141 taxa) of the data obtained could be assigned to species level (at least 99% similar to a species in the global reference databases) though additional species names were not disclosed yet for these taxa. The remaining taxa were identified to the lowest possible taxonomic level: 40% to genus (143 taxa), 9.8% to family (35 taxa), and the remainder to order (38 taxa). All the reported orders and family in the report have been also detected in this study. The report advances that the taxon count per class was: 195 fish, 30 amphibians, 78 birds, 50 mammals, and 4 reptiles. Once the detailed analysis is disclosed, a cross reference could be developed with the species identified by traditional methods and this could enrich the biodiversity baseline information.

² NatureMetrics. 2021. Preliminary Metabarcoding Results. Paracel S.A., 11 pp.

4. DISCUSSION

Overall, the findings of this study exceed the expectations in terms of creating a biodiversity baseline for both flora and fauna carried out over the 29.5 of effective field work both in flora and fauna monitoring. These monitoring days resulted in an investment of 4.21 days per sampling area for both seasons. The evidence given by the complementary species shows the rich biodiversity for the study area.

A total of 700 plant species, belonging to 97 botanical families were recorded: 22 pteridophytes, 139 monocots, 539 dicots. The study made it possible to survey and classify the plant formations of one of the most threatened and less known ecoregions at a country level, despite its importance at a regional and global level. The current knowledge of its biodiversity is based mainly on floristic studies dating back more than 100 years. The most recent studies were carried out within the last three decades, and were mainly based on the application of the REA methodology in preparation for the Technical Justifications and draft Management Plans for Protected Areas. There are also a few floristic studies of specific taxa that have been carried out by local and foreign specialists.

Despite the fact that the *Cerrado* formations in Paraguay occur as isolated mosaics within various ecoregions -such as Alto Paraná, Amambay and principally the Aquidabán (MADES 2013) in the Eastern Region of the country, as well as the *Cerrado* ecoregion in the Western Region- many typical species are common among them, although some are exclusive. Regarding the floristic diversity of the formations corresponding to the *Cerrado* phytophysionomies represented by the Cerradón, Campo Cerrado and Campo Sucio, in a comparative study carried out with 411 of the 700 species registered for the study area (which includes those identified by genus and morphospecies), it was found that there is a floristic affinity of 30-57% between these and the phytophysionomies of the *Cerrado* present in the departments of Canindeyu and Concepción. It was compared with the studies carried out by Peña-Chocarro et al. (2010), in the Mbaracayú Forest Nature Reserve, SEAM/UNDP/GEF (2006) in the Paso Bravo National Park, and Rojas Bonzi et al. (2020) in the Serranía San Luis National Park, when analyzing only those identified up to the species level of the 282 species recorded within the PARACEL project area (December 2021 campaign), we can confirm that the majority of them are in common. There are 162 species (57%) in common with the Mbaracayú Forest Nature Reserve, 127 species (45%) in common with the Paso Bravo National Park, and 85 species (30%) in common with the Serranía San Luis National Park. The complete list of analyzed/determined species is included in the [Vegetation and Flora](#).

The formations of savannas and especially those that are linked to water (periodically flooded, flooded or with permanent water), are dynamic ecosystems, whose species - mostly annual, biannual or perennial herbaceous - are adapted to fluctuations in water and other environmental factors that determine the presence or absence of species in different seasons. Due to their floristic diversity and the presence of water, these sites are places of passage and feeding for the local fauna, which contributes to the pollination and dispersal of plant species.

In the flooded savannas, which generally develop in the lower portions of the land, it is possible to find variants with water (marshes, swamps, bodies of water) and without water (dry savannas), disparities that would also influence the richness of species found. The presence of "Islets" in this formation adds a floristic diversity, mainly woody ones, which play a very important role for the local fauna, such as provision of perch, nesting and feeding place, refuge, etc. In the main matrix, these islands generally occupy the highest parts of the terrain. For more information on this matter please see [The islets of forests](#).

Mereles (2007) affirms forests are formations that exceed 5 m in height. In their vertical structure, they can have 3-4 strata of vegetation, reaching the primary layer or higher at a maximum height of 25 m. In most of them, the height of the trees in the first canopy no longer exceeds 15-18 m. In its horizontal structure there are several forms of life, such as: various herbaceous, shrubs, vines, epiphytes and trees; according to the geographic location where they are. In the case of the forest remnants studied, the riparian or marginal forest was the one that presented the greatest floristic diversity, compared to the high degraded forest, probably due to the degradation (extraction of timber) observed in the latter, in addition to the greater applied sampling intensity. In the Riparian or Marginal Forest, apart from the typical species of this formation, floristic elements belonging to the Cerrado phytophysionomy were recorded.

The fact that, although the study area is located at the extreme northwestern distribution of the Alto Parana Atlantic Forest (BAAPA), more than 40% of the tree species registered in the forest formations, High Forest and Riparian Forest, are common to the BAAP (Spichiger et al. 1992). On the other hand, it is important to point out that some species such as *Amburana cearensis* (clover), *Myroxylon peruiferum* (red incense) and *Syagrus oleracea* (guaviroba), are typical of the Cerrado Ecoregion, with a restricted distribution in the country.

Although there are recent studies and literature that make reference to the presence of several endemisms (Pena-Chocarro & De Egea 2018), as well as important plant genetic resources (De Egea et al. 2018) for food and agriculture -aspects of great importance and relevance worldwide- a more detailed analysis is required for a better assessment of the floristic resources present in the study area based on the high potential they represent; this, however, is beyond the objective and scope of this biodiversity baseline.

Among the four taxa evaluated, 438 species of vertebrates were recorded (81 fish, 59 amphibians & reptiles, 260 birds and 38 mammals), corresponding to 110 taxonomic families with some additional species of invertebrates. The collected species information of fauna presents all the necessary evidence for their confirmation within the site, thus making an innovative contribution towards the knowledge of this transitional area between the *Cerrado* and the Humid Chaco and Atlantic Forest.

With regard to the ichthyofauna within the study area, we can mention the records of an additional 13 species of fish to the number already documented for the Aquidabán River (Insaurralde et al. 2012). Nevertheless, these lists share three species (*Charax leticiae*, *Moenkhausia dichroura* and *Pyrrhulina australis*) between both places. The diversity of herpetofauna is considered to be high, and the use of transects for the active search of amphibians & reptiles is one of the most useful and feasible methods for rapid assessments and to get a get an idea of the composition of an area.

Regarding the threatened species, the anurans *Rhinella scitula* and *Dendropsophus elianae* are endemic species to the *Cerrado*, which also have their general distributional limits within the country. On the other hand, the reptiles *Chelonoidis carbonaria* and *Caiman latirostris* present other conservation challenges. These latter four species -two frogs, one tortoise and one caiman- could be the indicator species for the herpetofauna of the site.

Of the 460 documented species of birds (historical and recent records) for the Concepción Department (eBird 2020), 260 species (56.4%) were recorded during the best time of year for birdwatching, coinciding with the end of the breeding season for Neotropical birds (Hayes 2014) and for this most of the species were found active and also austral nesting migratory birds which initiate their migration to the north at the end of the summer in the Southern Hemisphere (Guyra Paraguay 2004). We had expected to find more endemic species cited for the *Cerrado* in Paraguay (Silva 1997), though endemic species of other ecological regions were recorded such as those of the BAAPA and the Dry Chaco. Similarly, it was expected to record other species associated with plant formations and natural communities typical of this ecoregion, such as seedeaters (*Sporophila* spp.) and other birds associated with natural grasslands and savannas, as well as other species of Macaw that could inhabit the area. This absence could respond to the modification of native grasslands habitats for productive activities (areas in which the woody vegetation - shrubs and coco palms, is removed, implanted forests, etc.) which could affect the availability of proper habits for these particular species. Despite this situation, several individuals of *Rhea americana* were recorded in all sampled sites within diverse habitats with natural grasslands or sabanoid-like environments ; this species conservation status is NT globally, as well as other species which are dependent of open areas such as Seriema cristata, *Nothura maculosa*, *Rynchotus rufescens*, and those of floodable or humid savannas such as *Emberizoides* spp. and particular seedeaters occurring in these *Cerrado* formations as the savannas of tall grasses, among them *Sporophila plumbea*, recorded in the dry season monitoring.

Nevertheless, it is worth mentioning that other species of interest that occur in the *Cerrado* were also found, which fall under different levels of national and international conservation status, in addition to the species that use this area as a stopover within their regional migratory routes, as well as other lesser known and under-recorded species in the region that use the habitats available at the site to complete their biological cycles. These are potential indicator species of the environmental quality and current condition of the study area. Among these species of interest, we can mention the Red Macaw (*Ara chloroptera*) which stands out as the flagship species of the *Cerrado* and in danger of extinction at a national level, given that this ecoregion is one of the last relics with the presence of a free population. Fifty-nine percent of the country's parrot species were recorded in the area and this entire order is included in Appendix II of CITES; they deserve certain protection actions related to trade, in order to avoid the reduction of their free populations. This is the family with the highest number of species of conservation concerns both at global and local levels; among them *Alipiopsitta xanthops*, endemic to the *Cerrado*, Endangered and NT. Both Psittacidae may be considered flagship species for the study area. *Crax fasciolata* and *Pipile cumanensis* are other species of interest, since the presence and abundance of both could indicate the quality of their habitat (mature forests and riparian forests), as well as help to evaluate their conservation status (Laíno et al. 2018). *Crax fasciolata* is threatened with extinction at a local level and Vulnerable at an international level, meanwhile *Pipile cumanensis* is Near Threatened at an international level, mainly due to habitat loss, unregulated hunting, and to a lesser extent, captured as pets. There are few studies of these species in Paraguay; consequently, their monitoring could be key to the design of strategies for their conservation.

We can highlight the findings for the order Carnivora, with the highest level of representation, and the Felidae family in particular with the observation of five of the eight species of felines in Paraguay. This phenomenon could reflect that the carnivore community, and therefore its prey, are in good condition; however, more profound studies should be carried out to better understand their conservation status.

All the species recorded during this campaign were "expected" for the area, with the exception of *L. braccatus*, whose record comes as a surprise considering the known distribution of the species (Nascimento et al. 2020), which reveals how poorly studied the mammalian fauna is in the region. The observed richness at each of the different localities does not necessarily reflect their true richness; for example, in the case of San Liberato and Hermosa with little sampling effort, we found a high species richness, what indicates these areas are very used by mammals. Something similar happens with the various natural communities, where the observed richness does not necessarily reflect the actual richness of these communities. This is due to the fact that the collection of data has different levels of effectiveness for the various communities and the sampling effort was not equal in all the communities explored. In rocky soils and grasslands for example, the likelihood of species detection by signs and prints was low, most of the records found in these sites were burrows in termite-hills (*takuru*), feaces or prints in clearings where mud was present. One common problem was the permanent presence of livestock prints prohibiting this to detect mammals' trails. Species with few records (sightings), such as the cui (apereá), the porcupine, the bats and the capuchin monkey, do not reflect the true abundance of these species since they are difficult to detect due to their habits, as well as the type of sampling implemented. On the other hand, it is highly likely that the pantanal cat has a very low abundance, taking into consideration that its "rarity" and elusive nature are widely known (Pereira & Aprile 2012).

From the data obtained and the corresponding analyzes, it can be concluded that the mammal community is widely dominated, in terms of abundance, by the crab-eating fox (*Cerdocyon thous*) in all the analyzed plant formations, with a co-dominance with the collared peccary (*Pecari tajacu*), and crab-eating racoon (*Procyon cancrivorus*) when it comes to plant formations associated with water. In forested areas, however, higher species richness and an almost exclusive presence of felines and primates were regularly found. In open areas (savannas and implanted pastures), the mammal community was also dominated by the bush fox; however, it was found that these areas are widely used by armadillos (*Euphractus sexcinctus*, *Dasyurus novemcinctus* and *Cabassus unicinctus*) and anteaters (*Myrmecophaga tridactyla* and *Tamandua tetradactyla*). These species especially take advantage of the almost ubiquitous presence of the takuru in open areas. In the case of anteaters, they use open areas mainly for feeding; but, on the other hand, armadillos also use these areas to make burrows, which can be found in abundance both in implanted pastures and in high and flooded savannas. Other mammals also use open areas, such as deer, peccaries, and felines. However, in the case of felines (puma, ocelot, jaguarundi, etc.), all the records were obtained near waterways or forests with seasonal lagoons, which allows us to establish the hypothesis that they would have a marked preference through wooded and open areas near riparian forests or tall forests.

Among the species mentioned by the people interviewed, we can mention the jaguar (*Panthera onca*), the maned wolf (*Chrysocyon brachyurus*), the Pampas deer (*Ozotoceros bezoarticus*) and the otter (*Lontra longicaudis*). These have been included in the list of recorded species considering the high probability of occurrence and the reliability of the testimonies. In the case of the jaguar, five people reported seeing the species in different sites within Paracel properties. The identified site is located within the Zanja Moroti ranch (22°35'49.29"S, 57°2'1.10"W), roughly 100 meters from a watercourse in an area with considerably large forest patches, Trementina (22°44'10.28"S, 56°54'37.43"W) and San Liberato (22 ° 36'46.51 "S, 56 ° 53'18.23 " W). Jaguar tracks were found in two of these locations (see photos in [Mammalogy](#)) and additionally one of the people who reported the species showed the team a photo of an attack on a calf that meets the specific characteristics of this species. For this reason, *Panthera onca* is considered an indirectly recorded species, until direct photographs were obtained.

Final report.

Biodiversity Baseline Study of Paracel Properties. Paracel S.A.
May 2021.

It is likely that this species is represented by one or very few individuals in the area, and uses the large patches of forest found on and outside the Paracel properties as a refuge. Likewise, it is possible that its movement is almost exclusively nocturnal between these patches and the riparian forests found in the area, so its probability of detection is very low.

Furthermore, the maned wolf (*aguará guasú*) was also reported by two people at different times in the same area, just north of the Estancia Soledad ranch, bordering the Paso Bravo National Park, additionally, during the dry monitoring activities, a maned wolf footprint was recorded in Santa Teresa. Estancia Soledad also happens to be the same ranch where the howler monkey was recorded. The otter was reported by several people in different areas, but always linked to watercourses; the species was sighted in Santa Teresa and Hermosa by the team members. Both the jaguar and the maned wolf could be flagship species, so it is extremely important that efforts be made to document their presence and monitor the use they make of the territory.

Descriptions of species that could not be fully identified were also received; for example, the “*tirika’i*”, which refers to a cat of the genus *Leopardus*, which based on distributions and citations could be either *L. guttulus* (Nascimento & Feijó, 2017) or *L. geoffroyi* (Cuyckens et al., 2015). Both species are cited for the area in other data collections for fauna, but there is no documentation to support these records. The mention of this record deserves attention because both possible species are included in Appendix I of CITES and, furthermore, *L. guttulus* is categorized as Vulnerable at both national and international levels. Other probable species of conservation interest, such as the giant armadillo (*Priodontes maximus*) and the bush dog or *jagua yvvy* (*Speothos venaticus*), were not recorded, neither directly nor indirectly through interviews. These three species fall under some category of national and international threat, and could be flagship species if their presence were confirmed in the area. A number of other species are cited for the area, but these were not detected during the surveys carried out during this first fieldwork campaign; these are, for the most part, marsupials, bats, and rodents. This is because the methodology and the sampling effort were mainly focused on medium and large mammals. Among the recorded species, six have been identified as being of special interest for conservation. Ecological aspects are briefly described for each, following Parera (2017) and Canevari & Vaccaro (2007), meanwhile their current conservation situations and main threats are based on IUCN (2021) and APM & SEAM (2017). These species are the jaguar (*Panthera onca*), the ocelot (*Leopardus pardalis*), the maned wolf (*Chrysocyon brachyurus*), the anteater or *yurumí* (*Myrmecophaga tridactyla*), the tapir or *mborevi* (*Tapirus terrestris*) and the white-lipped peccary or *tañycati* (*Tayassu pecari*). A summary of each of these six species is included in the [Mammalogy](#).

The effort especially aimed at bats, allowed to know more about this community since there is no published inventory in the study area; however, according to the work carried out to date (López - González et al., 1998; Gorresen & Willig, 2004; López-González, 2004, 2005; de la Sancha et al., 2017), it is estimated that there would be 33 Chiroptera species. Through the indirect methodology there were records of species, mostly insectivores, as highlighted in the literature regarding this guild with respect to the echolocation system and they can be more easily detected by acoustic recorders; in addition, a fish-eating species could be recorded with this method. Likewise, foraging activities could be identified in all sampling sites, which demonstrates their importance as a source of food resources for bat species. Vocalizations of bats that were not identified by the software or confirmed by the literature were documented as sonotypes.

Sonotypes are those vocal signatures that cannot be recognized, but are clearly different and can be grouped into different families and genera (Ochoa et al. 2000). The probability of other species present, even unrecorded for the area, is very high, so the development of more studies in the area should be taken into account and the two techniques used in this work (direct and indirect) must be combined. In Paraguay, knowledge about bats is incipient and scarce, so the work carried out with this group of mammals (such as the present study) is of utmost importance and yields novelties such as new records for the area, in this case that of *Saccopteryx leptura*, of the Emballonuridae family. This species, although it is listed by the IUCN as of Least Concern (<https://www.iucnredlist.org/species/19807/22005807>), reaches the limit of its distribution in Paraguay, and in the Red Book of Paraguay (Red Book of Mammals of Paraguay, 2017), is cataloged as DD; that is to say, of concern about the information gaps on the species. The other species registered (by the bioacoustic method) of the Emballonuridae family, *Peropteryx macrotis*, is also recorded for the IUCN as of Least Concern <https://www.iucnredlist.org/species/16709/22101100> , but in the Paraguay Data Book of Paraguay (Libro Rojo del Paraguay, 2017), is classified as vulnerable (VU), because it has an extremely restricted distribution and few records of it are known in the country. Additionally, there are no updated records of this species in Paraguay.

The presence recorded of Phyllostomidae bats (*Carollia perspicillata*, *Artibeus lituratus*, *Artibeus planirostris*, *Glossophaga soricina*, *Platyrrhinus lineatus*) considered regenerators of secondary forests (because they disperse seeds and pollinate flowers of pioneer plant species in forests) (Gorresen & Willig, 2004), reveal a good ecosystem health of the study area that allows the recovery of the system in the medium and long term. In general, the results obtained are relevant for the sampling areas, since it allowed the registration of most of the species described for the area, belonging to five different families of the six present in the country (Phyllostomidae, Vespertilionidae, Molossidae, Emballonuridae and Noctilionidae). Regarding the richness of species, this is satisfactory, taking into account the sampling nights and the limitations when choosing the sampling points. It is estimated that species richness and novelties could increase as more areas are sampled and sampling repetitions increase, especially those far from the properties' headquarters, where there are native forests with different levels of degradation.

The innovative eDNA³ developed by Paracel in its preliminary finding adds a species which has not been referenced or recorded during the survey and this is the Naked-tailed Armadillo (*Cabassous chacoensis*), which once the full report is obtained, should be incorporated into the final list of mammal species. The other four species of global conservation concern have been already identified in the field surveys, except for the confirmation of the Neotropical Otter (*Lontra longicaudis*); while the Turquoise-fronted Amazon (*Amazona aestiva*), the Greater Rhea (*Rhea americana*) and the Black-and-gold Howler Monkey (*Alouatta caraya*) have their presence confirmed by the conventional methods. For the species of fish, the most abundant sequence for *Pimelodella* sp., is to be contrasted with the three species identified in this study, while *Hoplias* sp the most commonly detected species may be contrasted with *Hoplias misionera*. The final report will elucidate information on information for 195 fish, 30 amphibians, 78 birds, 50 mammals and 4 reptiles.

³ NatureMetrics (2021)

Although fungi were not the main focus of this study, the presence of specialists was used to identify some specimens found. The description of the genera cataloged in this short survey showed that the number of species can be much higher, especially in the Riparian Forest (BR). Although the Cerradón species are of great importance, they are minor in occurrence. Fungi are natural bioindicators, which is why the occurrence of fungal species is associated with plant species. The mutualistic natural interactions between living organisms in forests are of vital importance, since some plants depend on these interactions for their existence. A larger and exhaustive sampling of fungal species is highly recommended to obtain more data on the fungus / plant coexistence and for the preservation of suitable environments for both types of organisms. With a larger and representative sampling, which covers all the identified plant formations, it will be possible to know the mycobiota in an integral way and thus study its interaction and importance, whether ecological or even for the use of resources in sustainable development.

Final report.

Biodiversity Baseline Study of Paracel Properties. Paracel S.A.
May 2021.

5. CONCLUSIONS

The study area was found with moderate to high anthropic disturbance; nevertheless, the first campaign of a rapid seasonal survey (rainy season) of the fauna and flora was carried out, fulfilling the objective of providing the first records for the resulting baseline and for future evaluations.

The 700 species of plants and 438 species of vertebrates recorded (besides the 40 species of fungi and other species of invertebrates) reflect the great potential of this site for conserving elements of the *Cerrado*, as well as other ecoregions that converge at this point, such as the Atlantic Forest and the Lower Chaco (Humid Chaco). Out of flora and fauna taxa, the diversity of fungi and invertebrates is still far from being known.

This study made it possible to survey and classify the vegetation formations of one of the most threatened, and yet lesser-known ecoregions at the country and global levels. The current knowledge of its biodiversity is based mainly on very old studies, dating back more than 100 years. The most recent studies date back from over the last three decades, mainly carried out applying the REA methodology and other floristic studies of specific taxa. This work reviews these studies and contributes towards the species expected to be found.

Although the *Cerrado* formations are present in the country as isolated mosaics within various ecoregions such as Alto Paraná, Amambay and mainly Aquidabán in the Eastern Region, as well as the *Cerrado* ecoregion in the Western Region, many typical species are common among them, while others are exclusive.

In spite of recent studies and publications that refer to the presence of various endemisms (Penachocharro & De Egea 2018) as well as plant genetic resources (De Egea et al. 2018) of importance for food and agriculture -aspects of great importance and relevance worldwide- a more detailed analysis is required that falls outside the scope of this biodiversity baseline. The same applies to the fauna discussed throughout the different sections.

The study area is considered one of the hot spots of the dendroflora of Paraguay by Spichiger et al. (1995), for constituting the meeting point between two different Floras, that of the Cerrado and that of south-east and south Brazil (Flora of the Cerrado and Flora Paranaense). Indeed, from a comparative analysis carried out with the 228 tree species that these authors mention as typical of these Floras, it was found that 59 of them (25.9%) are present in the study area. Of these, 37.3% are common to the Pleistocene Residual Dry Seasonal Flora, 26.3% to the Paranaense Flora, 5.5% to the Dry Chaco Flora, 16.7% to the Humid Chaco Flora and 29 , 5% to the Flora of the Cerrado.

Eighty-one species of fish were found corresponding to 27 families within five orders and one class. The most abundant species was *Odontostilbe pequira* for the seven sites (properties), followed by *Corydoras aeneus* and *Moenkhausia dichroura*. Only two species are of conservation concern, *Potamorhaphis eigenmanni* (VU) and *Odontostilbe pequira* (LC). These findings are considered most relevant for the area and their unprecedented characteristic contributes to the knowledge of the fauna of these underexplored areas. Their association with water and ecosystem health makes these fish key elements to monitor.

Amphibians and reptiles have a fundamental role in ecosystems, as they provide a number of ecosystem services such as dispersers, biological control, nutrient recycling, and others of more anthropogenic importance such as cultural, medicinal and nutritional (Valencia-Aguilar et al., 2013).

In addition, they constitute the highest biomass compared to other vertebrates in some environments (U.S. EPA 2002). Depending on the scale at which they are studied, amphibians can be good indicators of the condition of natural systems (Heyer et al. 1994), given that they use several ecosystems during their life cycle. Consequently, their monitoring is recommended, in particular within ecosystems that are threatened or subject to activities that alter the landscape, such as its structure and the use of agrochemicals (pesticides).

Within this statement fish are also incorporated, due to their relationship with the aquatic environment as indicated. Although the dimensions and the high heterogeneity of environments of the study area have not allowed obtaining a complete resolution of the diversity of amphibians and reptiles in the area, the findings were important and suggest more studies in the field, with the addition of passive methods of captures such as fenced pit traps (Corn 1994; Willson & Gibbons 2010).

From the ornithological point of view, despite the fact that the natural communities of the Cerrado that were evaluated were altered, and several areas could not be covered due to situations unrelated to the sampling campaign (insecurity), they still harbored species with several important criteria, when considering this faunal group as a tool to monitor the changes that have occurred and which will occur in the future in the area. The significance of the riparian forests is highlighted, since they were the communities with the greatest richness and abundance of bird species, followed by the floodable savannas with isolated islets made up of woody plants and vines. These results clearly demonstrate the remarkable value of these biological corridors between the different zones, including nearby protected areas, as well as their relevance in terms of the provision of fundamental ecosystem services, such as the provision of water and soil support. The predominance of species of the Psittacidae family (parrots, parakeets and macaws), a group highly sensitive to extraction for illegal trafficking and loss of habitat, in all plant formations suggests that they serve as a refuge and source of food for the species of this family of birds.

The presence of macaws in the area has potential as an ecotourism attraction, which offers a sustainable conservation strategy, as well as an added value to the environmental commitment of the project. The presence of *Crax fasciolata* and *Pipile cumanensis* highlights the importance of forest formations since this species have few current records in Paraguay, especially in the Eastern Region. For this reason, it is essential to pay special attention to this species within these plant formations. Species such as the Greater Rhea (*Rhea americana*), NT at international level and *Seriema cristata*, are two outstanding species dependent of open natural communities such as savannas and cerrado fields, both species are easy to detect when present and could be good indicators of habitat quality given their specific habitat types. Within the less conspicuous grassland and savanna species, the *Sporophila* seedeaters are good indicators as these species are affected by changes in humid grasslands and these species develop seasonal movements because of refuges and food.

All these species are large, striking, and charismatic, qualities that strengthen the potential to be considered flagship species in the study area. The area is home to species of interest with different states of conservation at national and international level, which occur in the Cerrado, in addition to the species that use this area as a stopping point within their regional migratory routes, which makes them potentially indicator species for implement measures and strategies that make the undertaking's environmental commitment visible.

The species richness of mammals observed during this work is satisfactory taking into consideration the number of days of sampling and methodological limitations (risk of theft of camera traps, for example). Nevertheless, the fact that evidence of unidentified species was found means that additional sampling methods should be used to increase the list of species, specifically for the smaller mammal species (bats, rodents and marsupials) by employing the use of traps and acoustic methods. Furthermore, it highlights the need to increase the sampling effort in areas where species of high importance could be detected and documented, such as the jaguar, the maned wolf, the pampas deer, the giant armadillo and the bush dog, among others. The records of unidentified tracks and the record of the pantanal cat confirm how poorly studied the area is. Based on these results, the technical team expects more surprises and estimates that species richness will continue to increase as more sites are sampled or more replications are carried out.

Furthermore, the records of species of interest for conservation such as the jaguar, the maned wolf, the tapir, the giant anteater, the ocelot and the white-lipped peccary, highlight the importance of the area, and these species should be the focus of conservation and research efforts. All are charismatic species, relatively easy to monitor and have great ecological value within the fauna communities, as well as being representative species of the region.

The project could be viable and compatible with the conservation of biodiversity, considering criteria such as: avoiding the elimination / degradation of native forests, avoiding planting in springs, riparian strips, wetlands and seasonally flooded areas, maintaining biological corridors and buffer strips, restricting and controlling hunting, wildlife capture or harassment; and complemented with a program for fire prevention and biodiversity monitoring.

Final report.

6. RECOMMENDATIONS

Recommendations can be grouped into six general axes (Figure 6–1). These groups could form part of a future Environmental and Social Management Plan, with key aspects that aim to safeguard the due diligence of the Paracel Project proportional to the nature and potential significance of the possible environmental and social risks and impacts.

Figure 6-1 Preliminary grouping of the recommendations resulting from the first campaign

- From the landscape and the structure of natural communities:
 - First, it is recommended as a priority to identify and maintain sites that can be ecologically functional as habitats for the occurrence of the species of interest.
- From sites with a particular natural richness:
 - Protect representative areas of all the plant formations identified within the study area, ensuring connectivity between them, considering they constitute habitats of great importance to ensure the conservation of biodiversity and the flow of populations and genetics.
 - Pay special attention to the protection of the formations of the Cerrado phytogeographies, given their importance from the point of view of their representativeness and biodiversity. This will allow for its recovery from the degradation processes due to grazing and the periodic burning that it has suffered for many years.
 - Maintain conservation areas in Soledad and Zapallo, site of *Discocactus hartmanii* occurrence. Maintain conservation areas as biodiversity corridors and relevant areas for feeding fauna and fulfilling other functions, which especially include the high Savannas, flooded Savannas and flooded Savannas; especially those areas where they coincide with the wooded formations.
 - Preserve the islets that are structurally and floristically functional parts of the vegetation mosaic, where the floodable Savanna is the main matrix. They are critical pieces that contribute to the overall stability and connectivity
- From the intervention with plantations:
 - Take good care when working on the design of the productive landscape, bearing in mind the core areas and the connectivity of the landscape, necessary for the long-term survival of species. Also, keep in mind that the grasslands, savannas and open areas constitute fundamental ecosystems of the *Cerrado* and that many species of mammals depend on these ecosystems.

- Avoid excessive interdigitation between forested and natural environments and minimize the contact surface. Maintain sufficient distance between natural environments (forests, bodies of water of all kinds, sabanoid formations) and forest plantations. Consider that some species of fauna (birds for example) feed in nearby open environments and the viability of populations requires different habitats and natural communities.

■ Biodiversity monitoring

- Prioritize the monitoring planned for the autumn-winter (dry season) and add new complementary surveying areas where possible.
- Prepare and carry out a permanent monitoring plan of the water conditions present in the ecosystem, for both the rainy season and the dry season.
- Create and implement a regular and ongoing monitoring plan for the flagship species that are selected in order to know how the community of mammals is affected by the forthcoming changes in land use with the forestry project, and have the support that this monitoring can generate to strengthen the commitment to the conservation of biodiversity.

■ Research

- Seek to record the phylogenetic resources that constitute endemisms and those recorded only a single time in the country more than 100 years ago.
- Carry out ecotoxicology studies to determine the effect of herbicides and insecticides on the genetic material and the survival of fish and amphibians.
- Implement studies that use birds as biological indicators of environmental quality and value their ecological functions within the area, providing an unprecedented importance at a national level, specifically associated with this productive activity.
- Create alliances with the Academia that allows for the inventory and monitoring of the rest of the biological diversity, such as the preliminary findings on fungi and invertebrates, as well as prioritizing research and providing a space for thesis work.
- Expand research to taxa that were not properly surveyed in this work, in particular with fungi, invertebrates and other groups that could provide important information on the interrelationships between biotic and abiotic environments.

■ Environmental awareness and education:

- Design awareness programs and establish prohibitions within the boundaries of the study area, to help maintain healthy community and populations, connected adequately, and especially for those species with some degree of threat.
- Work closely with the local communities to become familiar with their knowledge of wildlife, as well as the uses they make of it. Understanding these uses could be important, since changes in the landscape often lead to changes in animal behavior, which in turn

Final report.

May 2021.

7. ACKNOWLEDGEMENTS

- Special thanks to Mr. Cyro Croce and the entire PARACEL team for providing us with all the logistical support within the area during this data collection campaign, as well as the staff of the Gavilán Ranch for their hospitality.
- To Cristóbal Jara for his support and valuable contributions regarding the biodiversity of Estancia Soledad.
- To Mr. Gilberto Shupp for the accompaniment and for the contribution of documented records and relevant ethological observations for the validation of sign identifications.
- To Zulma Sosa for her support during the days of fieldwork within the study area.
- To Mr. Morales for identifying the safest access points to carry out the survey within the study area.
- To Barbara De Madrignac, Yolanda Ramos, Cristhian Báez and Óscar Feltes for their teamwork efforts which was key to achieving the proposed objectives.
- To Danilo Salas for the loan of the mist nets, and Leticia López for the poles to support these nets.
- To Hugo López, from the Museo de La Plata, for his kind support in assisting with the identification of fish.
- To Michelle Campi, from the Mycology Lab of the Universidad Nacional de Asuncion, for the identification of fungi.
- To Sergio Ríos for the identification of butterflies.
- To John Kochalka, from the National Museum of Natural History of Paraguay, for the identification of spiders.
- To Hugo del Castillo, for making available the Guyra Paraguay Biodiversity Database (BDBGP) for the preparation of the lists.
- To Hugo Cabral, Doctoral Student at the Universidade Estadual Paulista, for his contribution to the herpetological records.
- To the researchers who selflessly contributed to the identification of plant species of specific botanical families: Claudia Pereira (Passifloraceae), Nelida Soria (Asteraceae), Patricia Esquivel (Apiaceae), Irene Gauto (Arecaceae), Gloria Delmás de Rojas and Juana De Egea (Campanulaceae).
- To Jeffrey Thompson, Agustín Paviolo, Enrique Bucher y Gabriel Boaglio for the confirmation in the identification of wild cats.
- To Paul Smith for confirming the identification of *Cabassous unicinctus* y *Cerradomys scotti*.
- To Alberto Esquivel, for his support in the methodological design for the ornithofauna data collection, as well as for the identification of bird vocalizations recorded in the field and processed at the office.
- To Arne Lesterhuis and Andrés Álvarez, for their help with identification of psitacids recorded during the field surveys.
- To César Benitez, César Manchini Céspedes for fish, to Sara Escobar Chávez for amphibians and reptiles, and to Ruth Ferrando López for mammals during the dry season monitoring.
- To Juan Carlos Rudolf for the review of the report and the pertinent contributions.

- To Celso Fernández and Juan Careaga, field assistants in logistics and flora.

Final report.

Referencias:

MADES (Nacional) **EN** (En peligro de Extinción) especies categorizadas por la UICN como "EN, CR, DD"; **AE** (Amenazadas de Extinción): especies categorizadas como "VU" por la UICN.

CITES: **Apéndice I**: especies con mayor grado de peligro entre las especies de fauna y de flora, en peligro de extinción. CITES prohíbe el comercio internacional de especímenes de esas especies, salvo cuando la importación se realiza con fines no comerciales, i.e. para la investigación científica. **Apéndice II**: especies que no están necesariamente amenazadas de extinción pero que podrían llegar a estarlo a menos que se controle estrictamente su comercio.

Description of vegetal formations**DEGRADED HIGH FOREST**

Degraded high forest - San Liberato (L. Pérez de Molas)

Alcanza una altura de 16-18 m. Las especies del **estrato superior** *Talisia esculenta* (karaja bola), *Holocalyx balansae* (yvyra pepe), *Guibourtia hymenaeifolia* (kuruñai), *Albizia niopoides* (yvyra ju), *Guarea guidonia* (cedro blanco), *Cordia americana* (guajayvi), *Balfourodendron riedelianum* (guatambu), *Aspidosperma pyrifolium* (palo rosa), *Cupania vernalis* (jagua rata'y pytã), las especies del **Estrato medio** *Myrciaria cuspidata* (typcha ka'aguy), *Amburana cearensis* (trébol), *Astronium fraxinifolium* var. *glabrum* (urunde'y para morotí), *Peltophorum dubium* (yvyra pytã), *Casearia gossypiosperma* (mbavy guasu), *Aspidosperma pyrifolium* (palo rosa), *Chrysophyllum gonocarpum* (aguai), *Parapiptadenia rigida* (karupa'y rã), *Cassearia gossypiosperma* (mbavy guasu), *Helietta apiculata* (yvyra ovi), *Maclura tinctoria* ssp. *tinctoria* (tata jyva), *Cordia americana* (guajayvi), *Guibourtia hymenaeifolia* (kuruñai), *Albizia niopoides* (yvyra ju), **Estrato inferior** *Actinostemon conceptionis*, *Philyra brasiliensis*, *Trichilia catigua* (katigua pytã), *Neea pendulina*, *Myrciaria cuspidata* (typcha ka'aguy), *Annona emarginata* (aratiku'i),

Final report.

Randia calycina (ñuatí kurusu), *Casearia* sp.1, *Combretum leprosum*, *Attalea phalerata* (guacuri), *Randia aff. brevituba* (ñuatí kurusu), *Allophylus pauciflorus* (kokú), *Prockia crucis*, *Celtis iguanaea* (juasy'y).

El **sotobosque** es ralo, conformado por herbáceas, lianas, regeneración natural. Las especies presentes son *Dasyphyllum* sp., *Laciasis sorghoidea*, *Tocoyena formosa*, *Piper* sp.1, *Doryopteris pentagona*, *Justicia brasiliiana*, *Geophila repens*, *Oeceoclades maculata* (orquídea burrito), Epítitas como *Microgramma vacciniifolia* (anguja ruguai), *Pleopeltis minima*, Lianas como *Hippocratea volubilis*, *Dalechampia* sp..

En algunos sectores el sotobosque presenta dominancia de *Actinostemon conceptionis* y *Acanthocladus albicans*.

Se registró regeneración natural de *Trichilia elegans* (katiagua'i), *Protium heptaphyllum* (yvyra ysy), *Parapiptadenia rigida* (kurupa'y ra), *Ocotea diospyrifolia* (laurel sa'yju), *Rhamnidium elaeocarpum* (taruma'i), *Myrcianthes pungens* (guaviju), *Myrocarpus frondosus* (incienso), *olocalyx balansae* (yvyra pepe), *Amburana cearensis* (trébol), *Aspidosperma pyrifolium* (palo rosa), *Trichilia pallida* (katigua morotí), *Actinostemon conceptionis*, *Allophylus pauciflorus* (kokú).

En el borde y orilla del camino están presentes *Cordia trichotoma* (peterevy) y *Celtis iguanaea* (juasy'y). El suelo es arenoso, cubierto de hojarasca, con depresiones que forman áreas de acumulación de agua, muchos claros pequeños invadido por Pasto colonial.

TRANSITIONAL (ECOTONAL) FOREST BETWEEN DEGRADED HIGH FOREST AND CERRADON

Transitional (ecotonal) forest (high forest – cerradon) - Gavilan(L. Pérez de Molas)

Final report.

Biodiversity Baseline Study of Paracel Properties. Paracel S.A.
May 2021.

Alcanza una altura de hasta 11 m. **Estrato superior** *Inga uraguensis* (inga guasu), *Astronium fraxinifolium* var. *Glabrum* (urunde'y para morotí), *Guarea guidonia* (cedro blanco), *Protium heptaphyllum* (yvyra ysy), *Casearia gossypiosperma* (mbavy guasu), *Styrax* sp., **Estrato medio** *Trichilia pallens* (katigua morotí), *Trichilia pallida* (katigua morotí) **Estrato inferior:** *Peltophorum dubium* (yvyra pytã), *Casearia* sp.1, *Piper* sp.1, *Cordiera sessilis* (asuka revira), *Agonandra brasiliensis*.

En el borde del bosque aparecen *Didymopanax morototoni* (amba'y guasu), *Parapiptadenia rigida* (kurupa'y rã), *Enterolobium contortisiliquum* (timbó), *Anadenanthera colubrina* var. *cebilo* (kurupa'y kuru).

Sotobosque: *Myrsine* sp., *Rhamnidium elaeocarpum* (taruma'i), lianas como *Forsteronia glabrescens* (ysypo kamby), *Prockia crucis*, *Trichilia catigua* (katigua pytã), *Piper* sp.1 Se observó además abundante regeneración natural.

En algunos sectores este bosque alcanza una altura de solo 5-7 m, con emergentes de hasta 9 m dominado por *Attalea phalerata* (guacuri). Las especies del **Estrato superior** *Myracrodruon urundeuva* (urunde'y mi), *Sapium haemathospermum* (kurupika'y), *Attalea phalerata* (guacuri), *Ficus* sp. (guapo'y), en el **Estrato medio** *Samanea tubulosa* (manduvi rã), *Attalea phalerata* (guacuri), *Machaerium acutifolium*, *Ocotea diospyrifolia* (laurel sa'yju), *Protium heptaphyllum* (yvyra ysy), *Casearia* sp.1 **Estrato inferior** *Helicteres lhotzkiana*, *Maclura tinctoria* ssp. *Tinctoria* (tata jyva), *Guarea guidonia* (cedro blanco) y *Attalea phalerata* (guacuri).

El sotobosque es casi ausente, pocas lianas y muy poca regeneración natural. El suelo es arenoso, cubierto de abundante hojarasca. La topografía con pendiente suave.

Relevos:

RIPARIAN FOREST

Riparian Forest - Trementina stream (L. Pérez de Molas)

Riparian Forest - Gavilan (unnamed stream) (L. Pérez de Molas)

Se desarrolla en ribera del Arroyo Trementina, afluente de la margen derecha del Río Aquidabán.

Alcanza una altura de 16-18 m. **Estrato superior:** *Peltophorum dubium* (yvyra pytā), *Anadenanthera colubrina* var. *cebil* (kurupa'y kuru), *Protium heptaphyllum* (yvyra ysy), *Aspidosperma pyrifolium* (palo rosa), *Inga uraguensis* (inga pytā), *Copaifera langsdorffii* (kupa'y), *Handroanthus heptaphyllus* (tajy hu) **Estrato medio:** *Chrysophyllum marginatum* (pykasu rembi'u), *Sorocea sprucei* (Maria molle), *Albizia niopoides* (yvyra ju), *Phyllanthus chacoensis* (jakare pito), *Enterolobium contortisiliquum* (timbo), *Garcinia brasiliensis* (pakuri), *Eugenia uniflora* (ñangapiry), *Salacia elliptica* (pakuri brasilero), *Protium hetaphyllum* (yvyra ysy), *Chrysophyllum gonocarpum* (aguai), *Plathymenia reticulata* (morosyvo), *Coussarea platyphylla*, *Terminalia triflora* (guajayvi sa'yju), *Genipa americana* (ñandypa guasu), *Guibourtia hymenaeifolia* (kuruñai), *Vitex cymosa* (taruma), *Attalea phalerata* (guacuri), *Ocotea diospyrifolia* (laurel sa'yju), *Casearia gossypiosperma* (mbavy guasu), **Estrato inferior** *Casearia gossypiosperma* (mbavy guasu), *Salacia elliptica* (pakuri brasilero), *Parapiptadenia rigida* (kurupa'y rā), *Trichilia catigua* (katigua pytā), *Aspidosperma cylindrocarpon*, *Handroanthus ochraceus* (tajy sa'yju), *Garcinia brasiliensis* (pakuri), *Myrciaria cuspidata* (typycha ka'aguy), *Acanthocladus albicans*, *Cordiera sessilis* (asuka revira), *Zanthoxylum petiolare* (tembetary morotī), *Randia aff. brevituba* (ñuatī kurusu), *Coccoloba* sp., *Jacaranda mimosifolia* (jakaranda), *Guarea macrophylla* ssp. *spiciflora* (cedrillo), *Annona emarginata* (aratiku'i), *Trichilia pallens* (katigua morotī), *Machaonia brasiliensis*, *Miconia* sp., *Trichilia pallida* (katigua morotī), *Randia calycina* (ñuatī kurusu), *Bactris glaucescens* (karanda), *Coussarea platyphylla*, *Acanthocladus albicans*, *Celtis iguanaea* (juasy'y).

En algunos sectores del bosque *Guadua chacoensis* (takuara), formando pequeñas colonizaciones llegando hasta la orilla del curso principal, ocupando el segundo estrato del bosque. En los bordes *Annona nutans* (aratiku ñu) y *Machaerium hirtum*.

El **sotobosque** es ralo, con mucha hojarasca, el suelo es arenoso, con muy pocas lianas. Abundante regeneración natural de Myrtaceae e *Inga uraguensis* (inga guasu). Lianas: *Pisonia aculeata* (jagua pinda), *Forsteronia glabrescens* (ysypo kamby) y *Forsteronia pubescens*. Epifitas: *Microgramma vacciniifolia* (anguja ruguái), *M. persicariifolia*, *Polypodium* sp., *Rhipsalis* sp., *Campylocentrum* cfr. *neglectum* y otras herbáceas terrestres como *Adiantum latifolium* y *A. serrato-dentatum*.

También están presentes *Actinostemon conceptionis*, *Annona neosalicifolia* (Aratiku), *Syagrus romanzoffiana* (pindo), *Psychotria* sp., *Clavija nutans* (tumby rasy poha), *Acanthocladus albicans*, *Randia aff. brevituba* (ñuatī kurusu).

RIPARIAN FORESTAL IN GAVILAN (unnamed stream)

Bosque 8-10 m de altura. **Estrato superior:** *Ocotea disospyrifolia* (laurel sa'yju), *Trichilia pallida* (katigua morotī), *Genipa americana* (ñandypa guasu), *Samanea tubulosa* (manduvirā), *Guibourtia hymenaeifolia* (kuruñai), *Sapium haemathospermum* (kurupika'y), *Peltophorum dubium* (yvyra pytā), *Cordia americana* (guajayvi), *Inga uraguensis* (inga guasu), **Estrato medio:** *Cupania vernalis* (jagua rata'y pytā), *Salacia elliptica* (pakuri brasilero), *Chrysophyllum gonocarpum* (aguai), *Citrus aurantium* (apepu), *Trichilia pallida* (katigua morotī), *Attalea phalerata* (guacuri), *Syagrus romanzoffiana* (pindo), *Acrocomia aculeata*

Final report.

(mbokaja), Terminalia triflora (guajayvi sa'yju) **Estate Inferior:** Trichilia catigua (katigua pytā), Trichilia pallens (katigua morotī), Casearia sylvestris (burro ka'a), Protium heptaphyllum (yvyra ysy), Randia calycina (ñuatī kurusu) y Celtis sp.1 (juasy'y).

En el **sotobosque** están presentes Forsteronia glabrescens (ysypo kamby), Bromelia balansae (karaguata), Tocoyena formosa, Laccasis sp. y Miconia sp.

Existe abundante regeneración natural de especies arbóreas.

Relevos:

RIPARIAN FOREST (unnamed stream) (POTRERO ITA JURU)

Riparian forest - Soledad (L. Pérez de Molas)

Bosque 16-18 m. **Estrato superior:** Enterolobium contortisiliquum (timbo), Syagrus romanzoffiana (pindo), Guazuma ulmifolia (kamba akā), Cordia americana (guajayvi), Peltophorum dubium (yvyra pytā), Casearia gossypiosperma (mbavy guasu), Genipa americana (ñandypa guasu), Balfourodendron riedelianum (guatambu), Annona neosalicifolia (aratiku), **Estrato medio:** Trichilia catigua (katigua pytā), Sebastiania sp.1 (yvyra kamby), Holocalyx balansae (yvyra pepe), Averrhoa paraguaiense, Chrysophyllum gonocarpum (aguai), Maclura tinctoria ssp. tinctoria (tata jyva), Sebastiania sp. 2 (yvyra kamby), Samanea tubulosa (manduvirā), Parapiptadenia rigida (kurupa'y rā), Cupania vernalis (jagua rata'y pytā), Genipa americana (ñandypa guasu), Ocotea diospyrifolia (laurel sa'yju) **Estrato inferior:** Picramnia sellowii, Casearia gossypiosperma (mbavy guasu), Myrcianthes pungens (guaviju), Eugenia moraviana, Cupania vernalis (jaguarata'y pytā), Terminalia triflora (guajayvi sa'yju), Trichilia elegans

(katigua'i), Randia calycina (ñuatí kurusu), Guarea macrophylla ssp. spiciflora (cedrillo), Tabernaemontana catharinensis (sapiranguy), Casearia sylvestris (burro ka'a), Sebastiania sp.1, Terminalia triflora (guajayvi sa'yju), Parapiptadenia rigida (kuruap'y rã), Sorocea sprucei (María molle) e Inga uraguensis (inga guasu).

El **sotobosque** presenta manchones aislados de Pseudananas sagenarius (yvira), y Merostachys claussenii (takuapi), además de Trichilia elegans (katigua'i), Guarea macrophylla ssp. spiciflora (cedrillo) y Psychotria leiocarpa. Se observó pocas lianas, solo Forsteronia glabrescens (ysypo kamby), las epífitas presentes fueron Thaumatophyllum undulatum (guembe), Pleopeltis minima y Microgramma vacciniifolia (anguja ruguai), herbáceas terrestres como Geophila repens, Pharus lappulaceus, Pteris denticulata, Adiantopsis radiata (helecho sombrilla), Asplenium claussenii, Cfr. Hippeastrum sp. (lirio), Acalypha sp.1, y Desmodium sp.1.

La regeneración natural es abundante y diversa. Están presentes Averrhoa paraguaiense, Guibourtia hymenaeifolia (kuruñai), Salacia elliptica (pakuri brasilero), Chrysophyllum gonocarpum (aguai), Trichilia claussenii (catigua guasu), Monteverdia ilicifolia (kangorosa), Trichilia catigua (katigua pytã), Balfourodendron riedelianum (guatambu), Rhamnidium elaeocarpum (taruma'i), Cupania vernalis (jagua rata'y pytã).

El suelo es arenoso, con mucha materia orgánica. El arroyo corre encajonado, el agua es poco profunda, formando una barranca de aproximadamente tres metros, en algunos sectores corre sobre lecho rocoso, formando pequeños rápidos. El agua es de color blanquecino.

CERRADON

Cerradón - Soledad (L. Pérez de Molas)

Cerradón - San Liberato (L. Pérez de Molas)

Alcanza una altura de 14 m – 16 m. **Estrato superior:** *Amburana cearensis* (trebol), *Terminalia argentea* (capitán), *Myracrodruon urundeuva* (urunde'y mi), *Dilodendron bipinnatum*, *Enterolobium timbouva* (timbo), *Anadenanthera colubrina* var. *cebil* (kurupa'y kuru), *Pseudobombax tomentosum* (mandyju rā), *Tabebuia aurea* (paratodo), **Estrato medio:** *Averrhoa paraguaiense*, *Magonia pubescens* (yvyra hy'a), *Pseudobombax tomentosum* (mandyju rā), *Cordia americana* (guajayvi), *Acrocomia aculeata* (mbokaja), *Stryphnodendron rotundifolium* (barbatimao), *Myracrodruon urundeuva* (urunde'y mi), *Zanthoxylum caribaeum* ssp. *rugosum* (tembetary hū), *Casearia gossypiosperma* (mbavy guasu), *Aspidosperma pyrifolium* (palo rosa), *Luehea divaricata* (ka'a oveti), *Sterculia striata*, *Dimorphandra mollis* (lorito pysā), *Trichilia pallens* (katigua morotī), *Handroanthus ochraceus* (tajy sa'yju), *Aspidosperma tomentosum* (kirandy del cerrado), *Acrocomia aculeata* (mbokaja), *Syagrus romanzoffiana* (pindo), *Astronium fraxinifolium* var. *glabrum* (urunde'y para morotī), *Cecropia pachystacya* (amba'y), *Priogymnanthus hasslerianus* (ka'a vera), *Annona neosalicifolia* (aratiku), *Agonandra brasiliensis*, *Sapium haematospermum* (kurupika'y), *Samanea tubulosa* (manduvi rā), *Helietta apiculata* (yvyra ovi) **Estrato inferior:** *Acosmium subelegans*, *Erythroxylon suberosum*, *Rhamnidium elaeocarpum* (taruma'i), *Tabebuia roseo-alba* (tajy morotī), *Xylopia aromatica*, *Annona emarginata* (aratiku'i), *Tocoyena formosa*, *Plenckia populnea*, *Luehea divaricata* (ka'a oveti), *Casearia gossypiosperma* (mbavy guasu), *Ocotea minarum*, *Protium heptaphyllum* (yvyra ysy), *Dilodendron bipinnatum* (yvyra ruru), *Myrsine* sp. (kanelon), *Guettarda viburnoides*, *Coussarea platyphylla*, *Astronium fraxinifolium* var. *glabrum* (urunde'y para morotī), *Attalea phalerata* (guacuri), *Trichilia stellato-tomentosa*, *Celtis* sp.1 (juasy'y), *Duguetia furfuracea*, *Chrysophyllum marginatum* (pykasu rembi'u).

En el **sotobosque** están presentes *Smilax* sp. (ju'a peka), *Bromelia balansae* (karaguata), *Bromelia serra* (karaguata), *Scleria* sp., *Piper* sp.2, *Forsteronia glabrescens* (ysypo kamby), *Bauhinia cheilantha*, *B. cfr. mollis*, *Forsteronia pubescens*, *Passiflora* sp.1, *Passiflora* sp.2., *Ruellia angustiflora*, *Croton* sp.4, *Randia calycina* (ñuatī kurusu), *Trichilia stellato-tomentosa*, *Dorstenia cayapia* ssp. *paraguariensis* (tarope),

Brosimum gaudichaudi, *Campomanesia adamantium* (guavira mi), *Lasiacis* sp., *Bulbophyllum* sp., *Trichocentrum morenoi*, *Adiantum serrato-dentatum*, *Odontocarya tamoides* var. *canescens*, *Randia calycina* (ñuatí kurusu).

En los bordes *Bauhinia* sp., *Prestonia tomentosa*, *Sapium haemathospermum* (kurupika'y), *Myrsine* sp. (kanelón), *Jacaranda mimosifolia* (jakaranda), *Lygodium volubile*, *Annona emarginata* (aratiku'i).

En la transición del Campo Cerrado con el Cerradón, están presentes *Cereus stenogonus* (tuna), *Bromelia balansae* (karaguata), *Acrocomia aculeata* (mbokaja), *Dimorphandra mollis* (lorito pysa), *Agonandra brasiliensis*, *Tocoyena formosa*, *Aspidosperma tomentosum* (kirandy del cerrado), *Pouteria* sp. y *Duguetia furfuracea*,

Se registró la regeneración de las especies: *Dilodendron bipinnatum* (vvyra ruru), *Trichilia claussenii* (katigua guasu), *Bauhinia forficata* ssp. *pruinosa* (pata de buey), *Tabebuia roseo-alba* (tajy morotí), *Allophylus edulis* (kokú), *Annona emarginata* (aratiku'i), *Guazuma ulmifolia* (kamba akã), *Cordia americana* (guajayvi), *Anadenanthera colubrina* var. *cebilo* (kurupa'y kuru), *Amburana cearensis* (trebol), *Astronium fraxinifolium* var. *glabrum* (urunde'y para morotí), *Averrhoa paraguaiense*, *Pseudobombax tomentosum* (mandyju rã), *Syagrus romanzoffiana* (pindo), *Celtis* sp.1 (juasy'y), *Zanthoxylum rigidum* ssp. *hasslerianum* (tembetary), *Myrsine* sp. (kanelón), *Chrysophyllum marginatum* (pykasu rembi'u), *Cupania vernalis* (jagua rata'y pytã), *Trichilia stellato-tomentosa*, *Enterolobium timbouva* (timbo), *Trichilia catigua* (katigua pytã), *Tabebuia aurea* (paratodo), *Salacia elliptica* (pakuri brasilero).

El suelo es arenoso, con abundante hojarasca, evidencia de incendios, invasión de *Megathyrsus maximus* (Jack.) B. K. Simon & S.W.L. Jacobs var. *maximus* (pasto colonial) en los claros.

CAMPO CERRADO

Campo cerrado - Soledad (L. Pérez de Molas)

Formación sabánica caracterizada por la dominancia de subarbustos con sistema de xylopodio desarrollado, evidencia de quemas. El suelo es arenoso, con afloramientos rocosos (Granito) en las lomas. La roca madre está presente a unos 10 cm de profundidad, el terreno presenta fuerte pendiente hacia el este.

Especies dominantes *Campomanesia adamantium* (*guavira mi*), *Angelonia integrerrima*, *Bidens chodatii*, *Butia* sp., *Acrocomia hassleri* (*mbokaja'i*), *Croton glandulosus*, *Croton* spp., *Rhynchospora setigera*, varias especies de Poaceae y Cyperaceae, *Arachis pflugeae*, *Arachis nitida*, *Cenostigma marginatum*, *Senna paradryction*, *Borreria poaya*, *Eryngium sanguisorba*, *Ocimum ovatum*, *Microstachys hispida*, *Ruellia multifolia* var. *viscosissima*, *Aristida* sp., *Abildgaardia ovata*, *Annona dioica* (*aratiku*), *Oedochloa procurrens*, *Eriosema* sp., *Camptosema* sp., *Passiflora* sp.1, *Psidium* spp., *Cnidoscolus albonaculatus*, *Lippia lupulina*, *Ipomoea* spp., *Bulbostylis sphaerocephala*, *Evolvulus sericeus*, *Froelichia procera*, *Pouteria* sp., *Bromelia balansae* (*karaguata*), *Aspilia* sp., *Chrysolaena cognata* (*jagua raŷi*), *Ayenia* sp., *Mandevilla petrea*, *M.aff. pohliana*, *Discocactus hartmanii*, *Lippia* sp., *Erythroxylon suberosum*, *E. cuneifolium* (*coca del monte*), *Buchnera aff. longifolia* entre otros.

En San Liberato se registró en esta formación la presencia predominante de *Talisia angustifolia*, ocupando extensas áreas, alternando con matas aisladas de diversas especies de poaceas. En áreas de transición con el Cerradón se observó igualmente, poblaciones casi puras de *Pouteria* sp. y *Cyclolobium brasiliensis* y *Bromelia balansae* (*karaguata*), como así también regeneración de *Handroanthus ochraceus* (*tajy sa'yju*) y *Sapium haemathospermum* (*kurupika'y*).

Relevo: EM1S Coordenadas: 22° 39' 46,7"S 57° 12' 11,2"W, Altitud 219 msnm

CERRADO CAMPO SUCIO (GAVILÁN, SAN LIBERATO)

Campo sucio - Gavilán (L. Pérez de Molas)

Campo sucio -San Liberato (L. Pérez de Molas)

En Gavilán, formación caracterizada por presencia de especies con una altura máxima de 1,6 m, vegetación arbustiva, el suelo es arenoso, semicubierto con manchones de *Paspalum* sp. (pasto cavaju), arbustos formando grandes matas, presenta evidencia de ingreso de ganado vacuno y senderos.

En San Liberato, con menor cantidad de especies, evidencia de degradación, como mucho suelo desnudo, compactado, sobrepastoreado, ramoneado y rastros de quema.

Las especies características registradas *Talisia angustifolia*, *Anacardium humile* (*kaju'i*), *Byrsonima* sp., *Pouteria* sp., *Zornia* sp.1, *Annona dioica* (*aratiku*), *Schinus weinmannifolius* (*molle'i*), *Duguetia furfurácea* (*aratiku hata*), *Cnidoscolus albomaculatus*, *Annona nutans* (*aratiku ñu*), *Campomanesia adamantium* (*guavira mi*), *Annona emarginata* (*aratiku'i*), *Syagrus campylospatha* (*jata'i mi*), *Calliandra brevicaulis* var. *brevicaulis* (*niño azote*), *Orthopapus angustifolius*, *Adesmia* sp., *Psidium* sp.2, *Tocoyena formosa*, *Croton glandulosus*, *Croton* sp.1, *Forsteronia pubescens*, *F. glabrescens* (*ysypo kamby*), *Eriosema* sp., *Scoparia dulcis* (*typycha kuraty*), *Melochia villosa*, *M. parvifolia*, *Spermacoce verticillata* (*typycha corredor*), *Scleria* sp., *Sida cordifolia* (*malva blanca*), *Andropogon lateralis* (*kapi'i pytā*), *Hyptis* spp., *Desmodium* sp.1 (*taha taha*), *Acisanthera* sp., *Tibouchina* sp., *Pfaffia* sp., *Bromelia balansae* (*karaguata*), *Evolvulus sericeus*, *Trixis* sp., *Rhynchospora* sp.1, *Arachis nitida*, *Arachis paraguariensis* ssp. *paraguariensis*, *Eupatorium* sp.1, *Angelonia integrerrima*, *Mandevilla petrea*, *Bidens gardneri*, *Dorstenia brasiliensis* (*tarope*), *Paspalum* sp.3 (*kapi'i pe kavaju*) entre otras.

Es muy frecuente observar la presencia de isletas en contacto con las formaciones de sabanoides. Algunas especies características en estas isletas son: *Zanthoxylum rigidum* ssp. *hasslerianum* (Tembetary), *Myrsine* sp. (Kanelon), *Chrysophyllum marginatum* (Pykasu rembi'u), *Chomelia obtusa*, *Dimorphandra mollis* (Lorito pysa), *Tabernaemontana catharinensis* (Sapirangy), *Acanthocladus albicans*, *Psidium* sp.1 (Arasa), *Bidens pilosa* (Kapiuna), *Stachytarpheta cayennensis* (Tatu ruguai), *Cestrum* sp., *Solanum* sp., *Spermacoce verticillata* (Typycha corredor), *Melochia parvifolia*, *Mimosa* sp.2 (Jukeri), *Smilax* sp. (Ju'a peka) y en áreas de bordura, poblaciones puras de *Bromelia balansae* (Karaguata).

May 2021.

FLOODABLE SAVANNA (GAVILAN, SOLEDAD, TREMENTINA)

Sabana Inundable en Soledad (L. Pérez de Molas)

Vegetación acuática palustre en cuerpo de agua en Trementina (L. Pérez de Molas)

En Gavilán, en área de plantación de *Eucalyptus camaldulensis*, de aproximadamente 10 años de edad, con pastos de hasta 80 cm y leñosas creciendo aisladamente, de hasta 2 m. Se registraron *Pleurophora saccocarpa*, *Ludwigia* sp., *Echinodorus grandiflorus* (cucharero), *Pontederia cordata* (camalote), *Heteropterys* sp., *Aeschynomene* sp.1, *Paspalum* spp., *Eupatorium* spp., *Eleocharis elegans*, *Aspilia montevidensis*, *Caperonia* aff. *castaneifolia*, *Cuphea lysimachiooides* (ysypo pere), *Rhynchospora* spp., *Melochia simplex* entre otras.

En formación similar en Gavilán, sobre suelo arenoso-arcilloso (arena fina) gris, húmedo, se registraron también especies de la familia Poaceae del género *Paspalum* sp. creciendo en matas grandes, con inflorescencias que alcanzan hasta 2,5 m. Otras especies registradas fueron: *Psidium* sp.3 (arasa), *Sisyrinchium* sp., *Stylosantes* sp., *Setaria* sp., *Annona nutans* (aratiku), *Rhynchospora* sp., *Oedochloa procurrens*, *Imperata brasiliensis* (jahape), *Mimosa* spp. (jukeri), *Eleocharis* spp., *Hyptis* spp., *Cipura paludosa* spp. *boliviensis*, entre otras.

Se observó la presencia de senderos, rodeados de bosque de galería y bosque bajo de 8-10m. Ejemplares aislados de *Sapium haemathospermum* (kurupika'y), *Cecropia pachystachya* (amba'y), *Myracrodrun urudeuva* (regeneración), *Allophylus edulis* (kokü), *Schinus weinmannifolius* (molle'i), *Acrocomia aculeata* (mbokaya), *Butia paraguariensis* (jata'i).

La formación de esta categoría observada en Soledad, presentó como dominante a las especies de la familia Poaceae, con alturas de 0,9-1 m e inflorescencias de hasta 2,5 m. El suelo es oscuro, negruzco, húmedo y en partes más elevadas con anchas y profundas grietas y rastros de quema.

Se registraron: *Paspalum* sp., *Lobelia* aff. *nummularioides*, *Ludwigia hassleriana*, *L. nervosa*, *Rhynchospora* spp., *Cyperus* spp., *Lippia* sp., *Fimbrystylis* sp., *Melochia parvifolia*, *Mikania* sp., *Acalypha* sp.2, *Heteropteris* sp., cfr. *Hymenachne* sp.

En zonas de topografía más alta, se registraron: *Stillingia* aff. *salpingadenia*, *Desmodium* sp.2, *Oxypetalum* sp., entre otras especies.

En Trementina se registró la presencia de una laguna vegetada, con una superficie 80 x 50 m, cuyo posible origen fue el represamiento de un cauce hídrico. Se relevaron las siguientes especies enraizadas en el fondo: *Eleocharis elegans* y *Eleocharis* sp. (dominantes), manchones de *Pontederia azurea* (aguape puru'a); en el borde, pero dentro del agua *Utricularia* sp., *Lemna minuta*, *Pontederia cordata* (camalote)

y *Nymphoides verrucosa*. En el borde y rodeando el cuerpo del agua se presentan *Ludwigia* sp., *Scoparia dulcis* (*typycha kuratu*), *Phyllanthus niruri* (*para para'i*), *Setaria* sp., *Hymenachne amplexicaule* (*camalotillo*), *Sida cordifolia* (*malva blanca*), *Polygonum* sp. (*ka'a tai*), *Aeschynomene* sp., *Eupatorium* sp.3.

En lugares con topografía más elevada, aparecen *Sapium haematospermum* (*kurupika'y*), *Cecropia pachystachya* (*amba'y*), *Sorocea sprucei* ssp. *saxicola* (*Maria molle*), *Tocoyena formosa*, *Acrocomia aculeata* (*mbokaja*), *Vitex cymosa* (*taruma*), *Ocotea diospyrifolia* (*Laurel sa'yju*), *Bromelia balansae* (*karaguata*).

PALM WAX COPERNICIA ALBA FLOODABLE SAVANNA

Sabana inundable de *Copernicia alba* en San Liberato (Lidia Pérez de Molas)

Formación que se caracteriza por estar sometida a inundaciones, quemas periódicas y pastoreo extensivo. La especie dominante en el estrato superior es *Copernicia alba* (*karanda'y*), acompañada de individuos muy aislados de *Acrocomia aculeata* (*Mbokaja*), *Machaerium hirtum*, *Peltophorum dubium* (*yvyra pytā*), *Copaifera langsdorffii* (*kupa'y*), *Terminalia triflora* (*guajayvi sa'yju*), *Sapium haemathospermum* (*kurupika'y*), *Zanthoxylum hirtum* ssp. *hassleri* (*tembetary*), *Cereus stenogonus* (*Tuna*), *Tocoyena formosa*. En algunos sectores se observó poblaciones puras de *Talisia angustifolia*, *Bromelia balansae* (*karaguata*), *Syagrus campylospatha* (*jata'i mi*), *Annona nutans* (*aratiku*), *Thaumatophyllum undulatum* (*guembe*) y *Annona dioica* (*aratiku*),

El estrato herbáceo es continuo y dominado por varias especies de la familia Poaceae, entre ellas *Aristida* sp., en particular se observó la presencia de varias especies de *Arachis* spp.

Final report.

HIGH SAVANNA (ESPARTILLAR) (UNFLOODABLE)

High savanna in San Liberato (L. Pérez de Molas)

Sabana no inundable con dominancia de *Elionurus muticus* (espartillo), formando grandes matas, acompañada por *Aristida* sp., y ejemplares aislados de *Attalea phalerata* (guacuri), *Aspidosperma tomentosum* (kirandy del cerrado), *Butia* sp., *Annona dioica* (aratiku), *Pouteria* sp., *Talisia angustifolia*, *Sapium haemathospermum* (kurupika'y), *Syagrus campylospatha* (jata'i mi), *Melochia villosa*, *Arachis* spp., *Croton* sp.1.

En algunos sitios se observan pequeñas islas de *Acrocomia aculeata* (mbokaja), *Ocotea diospyrifolia* (Laurel sa'yju), *Sapium haemathospermum* (kurupika'y), *Cereus stenogonus* (tuna), *Enterolobium timbouva* (timbo), *Cecropia pachystachya* (amba'y), *Tocoyena formosa*. Los bordes están colonizados por *Bromelia balansae* (karaguata).

Se desarrolla sobre suelos arenosos y con topografía más elevada. Presenta rastros de quema.

DEGRADED HIGH FOREST (BA)

Degraded High Forest. Santa Teresa. 26.03.2021. Lidia Pérez de Molas.

Es un bosque semicaducifolio con una altura de 22-25 m, presenta tres estratos, **Estrato superior:** *Myroxylon peruferum* (incienso colorado), *Peltophorum dubium* (yvyra pyta), *Myrtaceae* (Arraijan), *Guibourtia hymenaeifolia* (kuruñai), *Anadenanthera colubrina* var. *cebil* (kurupa'y kuru), *Balfourodendron riedelianum* (guatambu), *Sideroxylon obtusifolium* (guajayvi rai), *Ceiba* sp. (samu'u), *Enterolobium timbouva* (timbo), *Myracrodroon urundeava* (urunde'y mi), *Handroanthus impetiginosus* (lapacho rosado) **Estrato medio:** *Holocalyx balansae* (yvyra pepe), *Calycophyllum multiflorum* (palo blanco), *Maclura tinctoria* ssp. *tinctoria* (tata jyva) *Parapiptadenia rigida* (kurupa'y rã), *Guazuma ulmifolia* (kamba akã), *Casearia gossypiosperma* (mbavy guasu), *Averrhoidium paraguaiense*, *Chrysophyllum gonocarpum* (aguai), *Pterogyne nitens* (yvyra ro), *Myrcianthes pungens* (guaviju), *Agonandra brasiliensis*, *Syagrus oleracea* (guaviroba), *Neea* sp., *Samanea tubulosa* (manduvira), *Helietta apiculata* (yvyra ovi), *Myrciaria cuspidata* (typycha ka'aguy), *Attalea phalerata* (guacuri), **Estrato inferior:** se destaca la dominancia de *Gymnanthes discolor*, acompañada por *Trichilia catigua* (katigua pyta), *Trichilia pallida* (katigua moroti), *Adelia membranifolia*, *Allophylus pauciflorus* (koku), entre otros.

El **sotobosque** es ralo con abundantes lianas, principalmente *Pisonia aculeata* (jagua pinda), *Semialarium paniculatum* y varias especies de Bignoniaceae, algunas epífitas como *Thaumatophyllum undulatum* (guembe), *Peperomia aceroana*; herbáceas y leñosas terrestres como *Pharus lappulaceus* (ka'i arro), *Pteris denticulata*, *Doropteris* sp., *Dioscorea* sp., *Pseudananas sagenarius* (yvira), *Randia* sp. , *Trichilia elegans* (katigua'i) y *Clavija nutans* (tumby rasy poha).

Final report.

Biodiversity Baseline Study of Paracel Properties. Paracel S.A.
May 2021.

Aunque la regeneración natural se presenta escasa, está presente, algunas de ellas son: *Holocalyx balansae* (yvyra pepe), *Chrysophyllum gonocarpum* (aguai), *Sweetia fruticosa* (taperyva guasu) y *Helietta apiculata* (yvyra ovi).

Ocupa las porciones más altas del terreno, en formaciones discontinuas de variable extensión, alternando con grandes superficies de sabanas altas e inundables. El suelo es arenoso, rojo, cubierto por abundante hojarasca. En algunos sitios aparecen afloramientos rocosos.

Se observó la presencia de grandes hormigueros y algunas madrigueras de fauna. Además algunos tocones de grandes árboles cosechados y vías de saca ya en desuso.

RIPARIAN OR MARGINAL FOREST (BR)

Riparian Forest or marginal foresto n Napegue Stream
and bordering a flooded savanna. Santa Teresa.
26.03.2021. Lidia Pérez de Molas.

Dry waterbed of Negla'i stream. Zapallo. 29.03.2021.
Lidia Pérez de Molas.

Se desarrolla generalmente en ambas márgenes de un curso de agua. Es un bosque de unos 18-20 metros de altura, con tres estratos. **Estrato superior:** *Anadenanthera colubrina* var. *cebil* (kurupaí kuru), *Copaifera langsdorfii* (Kupa'y), *Handroanthus ochraceus* (tajy sa'yju), *Peltophorum dubium* (yvyra pyta), *Inga uraguensis* (inga gusu), *Myracrodruon urundeuva* (urunde'y mi), *Sweetia fruticosa* (Taperyva guasu), *Aspidosperma pyrifolium* (palo rosa), *Guibourtia hymenaeifolia* (kuruñai), *Schefflera morototoni* (amba'y guasu), *Nectandra aff. cissiflora* (laurel ne), *Pseudobombax tomentosum* (mandyu ra), *Enterolobium timbouva* (timbo), **Estrato medio:** *Chrysophyllum gonocarpum* (Aguai), *Tapirira guianensis* (ka'a mbota), *Averrhoiodium paraguaiense*, Myrtaceae, *Salacia elliptica* (pakuri brasilero), *Casearia gossypiosperma* (mbavy guasu), *Syagrus romanzoffiana* (pindo), *Attalea phalerata* (guacuri), *Protium heptaphyllum* (Yvyra ysy), *Campomanesia xanthocarpa* (guavira pyta), **Estrato inferior:** *Genipa americana* (ñandypa guasu), *Cecropia pachystachya* (amba'y), *Neea* sp., *Guarea macrophylla* ssp. *spiciflora* (cedrillo), *Helietta apiculata* (yvyra ovi), *Citrus aurantium* (apepu), Myrtaceae, *Coussarea platyphylla*, *Casearia sylvestris*

(burro ka'a), *Gymnanthes discolor*, *Croton urucurana* (sangre de drago), *Garcinia brasiliensis* (pakuri), *Trichilia catigua* (catigua pyta), *Trichilia pallida* (katigua moroti) y *Helicteres lhotzkyana*.

En riberas de los Arroyos Trementina y Hermosa se han registrado la presencia de tacuarales de *Guadua chacoensis* (takuara) de más de 15 metros de altura.

El sotobosque es ralo. Las especies presentes son *Clavija nutans* (tumby rasy poha), *Trichilia elegans* (katigua'i), *Xylosma venosa* (ñuati pyta), *Psychotria carthagagenensis*, *Randia* spp. (ñuati kurusu), Epífitas como *Taumathophyllum undulatum* (guembe), *Microgramma persicariifolia*, *Phlebodium decumanum* (calaguala), terrestres como *Geophila repens*, *Dorsternia cayapia* ssp. *paraguariensis* (tarope) y *Oeceoclades maculata* (orquídea burrito). Algunas lianas son *Pisonia aculeata* (jagua pinda), *Cissus erosa* (parral saite), *Smilax* sp., *Cardiospermum grandiflorum* (ysypo kamambu) y *Paullinia pinnata*. Se destaca el hallazgo de *Lophophytum mirabile* (yvoty yvy), una parásita radicular registrada en el bosque ribereño del arroyo Negla. El suelo es arenoso y cubierto por abundante hojarasca. El barranco es casi vertical de unos 3 a 4 m de altura. El Arroyo Negla'i se encontraba con el cauce totalmente seco.

Se registró además la presencia de grandes árboles cortados y abandonados en el bosque de antigua data, además de tocones. Igualmente, en el Bosque Ribereño del Arroyo Hermosa se registraron signos de aprovechamiento.

CERRADO FIELD OR “CAMPO CERRADO” (CC)

Cerrado Field in a pastureland of *Urochloa brizantha*.
 Hermosa. 4.4.2021. (L. Pérez de Molas)

Cerrado Field. Hermosa. 4.4.2021
 (Lidia Pérez de Molas)

Es una formación sabánica caracterizada por la predominancia de especies arbustivas y subarbustivas con importantes sistemas radiculares de perduración como los xilopodios. Se desarrollan generalmente sobre suelos arenosos y están sometidos a quemas periódicas. Las especies herbáceas también están presentes, aunque en menor proporción.

Algunas especies características son: *Campomanesia adamantium* (guavira mi), *Croton campestris*, *Duguetia furfuracea* (aratiku), *Orthopapus angustifolius*, *Vernonantura chamaedrys* (typcha moroti), *Anacardium humile* (kaju'i), *Talisia angustifolia*, *Eryngium ebracteatum*, *Schinus weinmannifolius*, *Sida linifolia*, *Spermacoce verticillata* (typcha corredor), *Croton glandulosus*, *Mandevilla petraea*, *Oxalis renifolia*, *Annona dioica* (aratiku), *Ayenia tomentosa*, *Arachis* sp., *Desmodium barbatum* (taha taha), *Orthopapus angustifolius*, *Mimosa xanthocentra* (jukeri), *M. debilis*, *Microstachys hispida*, *Calliandra brevicaulis*, *Turnera grandiflora*, *Psidium* spp., *Allagoptera* sp., *Butia* sp., *Waltheria* sp., *Melochia* sp., *Schizachyrium* sp., *Lygodium venustum*, *L. volubile*, *Indigofera* sp., *Rhynchosia* sp., *Zornia* spp., *Indigofera elegans*, *Ximenia intermedia*, *Pterocaulon* spp., *Evolvulus sericeus*, *Aeschynomene* spp., *Adiantum serrato-dentatum*, *Riedeliella graciliflora*, *Cnidoscolus albomaculatus* y *Synedrellaopsis grisebachii*.

La formación se encuentra en estado degradado, ya que en la actualidad es una pastura de *Urochloa brizantha*, en Hermosa, sometida al sobre-pastoreo. Las especies del cerrado que se han registrado en esta pastura indican que la vegetación original ha sido ésta. Otras características que suman a la degradación es la presencia de mucho suelo desnudo, una red de senderos muy erosionados y compactados, rastros de quemas periódicas, abundantes heces de ganado y grandes hormigueros. Se registró además algunas madrigueras activas de fauna.

Final report.

DIRTY FIELD OR “CAMPO SUCIO” (CS)

Dirty field or “Campo sucio”. Zapallo. 31.03.2021. Lidia Pérez de Molas.

La fitofisionomía corresponde a una sabana caracterizada por la presencia de subleñosas y herbáceas, principalmente, especies de Poaceae, Asteraceae, Euphorbiaceae, Fabaceae. Las Poaceae cubren gran parte de la superficie del suelo, con sus grandes matas. Algunas especies presentes son *Talisia angustifolia*, *Mandevilla petraea*, *Mimosa debilis* (jukeri), *Spermacoce verticillata* (typycha corredor) *Andropogon lateralis* (kapi'i pyta), *Sida linifolia*, *Pfaffia* sp., *Desmodium barbatum* (taha taha), *Croton glandulosus*, *Microstachys hispida*, *Aeschynomene elegans*, *Oedochloa procurrens*, *Solanum viarum* (mboi rembi'u), *Arachis* sp., *Aristida* sp., *Adiantum serrato-dentatum*, *Ruellia* sp., *Annona dioica* (aratiku), *Hyptis* spp.,

Se desarrolla en partes altas del terreno, con suave pendiente, en él alternan las isletas de diferente tamaño y biodiversidad. Algunas especies presentes en las isletas son: *Cordia glabrata* (peterevy moroti), *Machaerium hirtum*, *Sapium haemathospermum* (kurupika'y), *Acosmium subelegans*, *Acrocomia aculeata* (mbokaja), *Tapirira guianensis* (camboata), *Handroanthus heptaphyllus* (Tajy hu), *Annona nutans* (aratiku ñu). En los bordes de las isletas se encuentran *Bromelia balansae* (karaguata) y *Syagrus campylospatha* (jata'i mi).

High savanna. Santa Teresa. 27.03.2021.
Lidia Pérez de Molas.

Formación caracterizada por un estrato herbáceo con predominancia de Poaceae con matas grandes, herbáceas y subleñosas, alternando con árboles aislados de *Acrocomia aculeata* (mbokaja), *Machaerium hirtum*, formando pequeños grupos, *Salacia elliptica* (pakuri brasilero) y arbustos como *Tocoyena formosa*. Así mismo la fitofisionomía incluye isletas de diferente tamaño y biodiversidad.

Especies características: *Elionurus muticus* (espartillo), *Hyptis* spp., *Arachis* spp., *Eupatorium* sp., *Melochia* aff. *pilosa*, *Adiantum serrato-dentatum*, *Lygodium volubile*, *Rhynchospora nervosa*, *Mimosa xanthocentra* (jukeri), *Aeschynomene elegans*, *Chamaecrista* aff. *nictitans*, *Scleria distans*, *Crotalaria maypurensis*, *sauvagesia erecta*, *Pterocaulon alopecuroides*, *Buchnera longifolia*, *Microstachys hispida*, *Zornia* sp., *Bauhinia* sp., *Croton campestris*, *C. andinus*, *Sida linifolia*, *Mimosa debilis* (jukeri), *Chamaecrista flexuosa*, *Mandevilla petraea*, *Schizachirium* sp., *Andropogon selloanus*, *Aristida* sp., *Oedochloa procurrens*, *Lippia* aff. *turnerifolia* var. *turnerifolia*, *Evolvulus sericeus*, *Mimosa dolens* (jukeri), *Polygala linoides*, *Desmodium barbatum* (taha taha), *Stachytarpheta cayennensis* (tatu ruguai), *Acisanthera alsinaefolia*, *Oxalis renifolia*, *Malvastrum coromandelianum*, *Andropogon lateralis* (kapi'i pyta), *Paspalum* spp., *Croton glandulosus*, *Spermacoce verticillata* (typcha corredor).

Las especies de *Pterocaulon lanatum* y *Sidastrum paniculatum*, *Solanum granulosum-leprosum* (hu'i moneha) son las dominantes como invasoras en las pasturas sobrepastoreadas y degradadas.

Las isletas presentan una altura de 5 hasta 8 metros, con estrato arbóreo, arbustivo y herbáceo. Las especies presentes son: *Sapium haemathospermum* (kurupika'y), *Ocotea diospyrifolia* (aju'y sa'yju), *Zanthoxylum rigidum* ssp. *hasslerianum* (tembetary), *Casearia sylvestris* (burro ka'a), *Chrysophyllum marginatum* (pykasu rembi'u), Myrtaceae, *Handroanthus impetiginosus* (Lapacho rosado), *Genipa americana* (ñandypa guasu), *Handroanthus ochraceus* (tajy sa'yju), *Astronium fraxinifolium* var. *glabrum* (urunde'y para moroti), *Tocoyena formosa*, *Xylosma venosa* (ñuati pyta), *Psidium* spp. (arasa mbaja), *Chomelia obtusa*, *Varronia* sp., *Randia* spp. (ñuati kurusu). Las lianas y arbustos apoyantes presentes son: *Paullinia pinnata* y *Aegiphilla verticillata*. Los bordes se encuentran colonizados por *Bromelia balansae* (karaguata).

Final report.

Biodiversity Baseline Study of Paracel Properties. Paracel S.A.
May 2021.

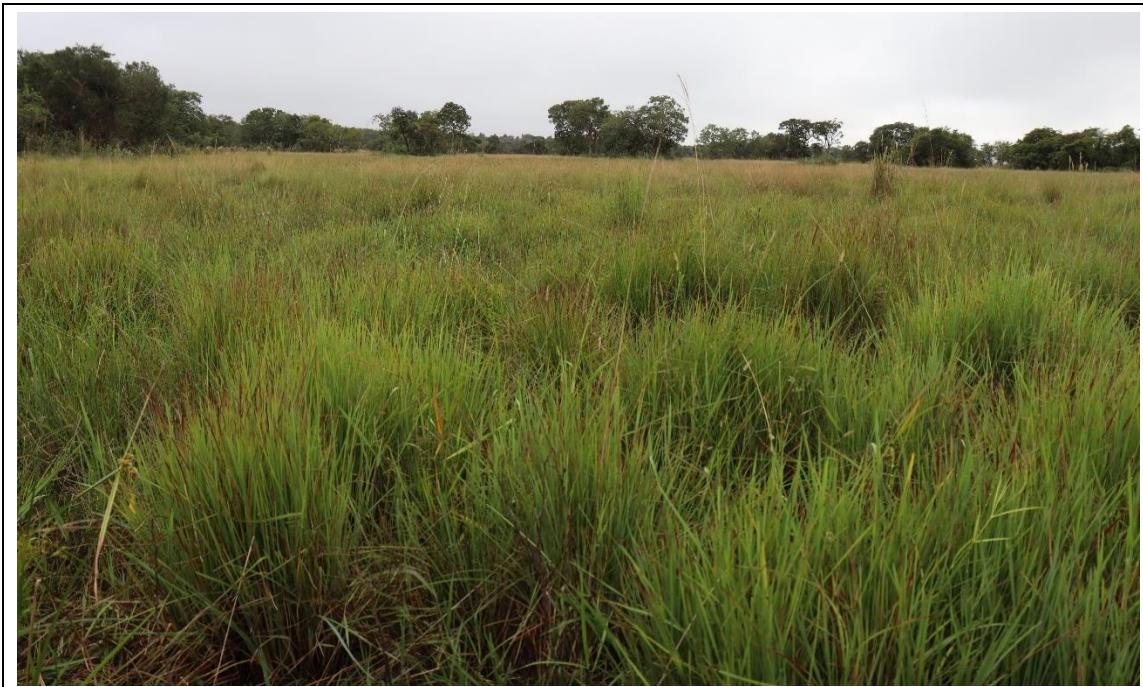

Ocupan los lugares más altos del terreno. El suelo es arenoso o arcilloso y muy seco. Existen rastros de quemas, senderos y heces de ganado.

El potrero con pastura de *Urochloa brizantha*, presenta una alta densidad de ejemplares adultos y regeneración natural de *Attalea phalerata* (guacuri), individuos aislados de *Sapium haemathospermum* (kurupika'y), *Anadenanthera colubrina* var. *cebil* (kurupa'y kuru), *Helietta apiculata* (yvyra ovi), *Machaerium aculeatum* (yvyra tanimbú), *Luehea divaricata* (ka'a oveti), *Ficus* sp. (guapo'y), *Lonchocarpus pluvialis*, *Acosmium subelegans*, *Zanthoxylum riedelianum* (tembetary sa'yju), entre otros.

FLOODABLE SAVANNA WITH FOREST ISLANDS (SI)

Flooded savanna. Santa Teresa. 28.03.2021. Lidia Pérez de Molas.

Se caracteriza por presentar un estrato herbáceo dominante formado principalmente por especies de Poaceae y Cyperaceae creciendo en grandes matas y muchas veces alcanzando una altura de más de 1 metro. Las especies características son: *Cyperus giganteus* (piri guasu), *Paspalum intermedium*, *Aeschynomene aff. americana*, *A. elegans*, *Pontederia cordata* (kamalote), *Byttneria* sp., *Vernonanturna brasiliiana*, *Commelina diffusa* (santa lucia hovy), *Acalypha* sp., *Ludwigia nervosa*, *L. filiformis*, *L. hassleriana*, *L. sericea*, *Cuphea lysimachoides* (ysypo pere), *Rhynchospora* spp., *Hetropterys glabra*, *Melochia parvifolia*, *Acisanthera alsinaefolia*, *Tibouchina* sp., *Schlutesia* sp., *Nymphoides indica*,

Echinodorus sp., *Sauvagesia erecta*, *Angelonia integerrima*, *A. salicarifolia*, *Polygala linoides* var. *linoides*, *P. molluginifolia*, *Lippia* aff. *turnerifolia* var. *turnerifolia*, *Stemodia* spp., *Corchorus argutus*, *Cipura paludosa* ssp. *boliviensis*, *Cantinoa althaeifolia*, *Hydrolea elatior*, *Caperonia* aff. *castaneifolia*, *C. palustris*, *Lessingianthus rubricaulis*, *Campuloclinium macrocephalum*, *Eryngium ebracteatum*, *Justicia laevilinguis*, *Schizachyrium* spp., *Eleocharis* spp., *Polygonum* spp. Entre las lianas se destacan *Mikania* sp. y *Rhabdadenia ragonesei*.

Ocupan las zonas de altitud intermedia entre la sabana alta y la sabana inundada. El suelo es arcilloso, oscuro, con abundante materia orgánica, y sufren inundaciones (septiembre a noviembre) y quemas periódicas principalmente en el otoño-invierno.

En las áreas más bajas, y con agua permanente, aparecen poblaciones casi puras de *Thaumatophyllum undulatum* (guembe) y especies de Poaceae (Kapi'i pe'y) y Cyperaceae, como *Cyperus giganteus* (piri guasu). En algunos sitios se presentan ejemplares aislados de *Sesbania exasperata*, *Machaonia brasiliensis* y *Helicteres gardneriana*.

Estas áreas también representan a los potreros con pasturas implantadas de *Urochloa humidicola*.

Presenta evidencias de degradación como huellas profundas, senderos muy erosionados y heces de ganado. Son potreros de cría, con carga permanente.

Alternando con la sabana inundable y en lugares más altos, casi siempre con presencia de uno a tres hormigueros con sus respectivas madrigueras, se encuentran las isletas, con forma, tamaño y biodiversidad variable, caracterizada por elementos florísticos de los cerradones como *Dipteryx alata*, *Dilodendron bipinatum*, *Xylopia brasiliensis*, *Acrocomia aculeata* (mbokaja), *Sapium haemathospermum* (kurupika'y), *Acosmum subelegans*, *Guibourtia hymenaeifolia* (kuruñai), *Handroanthus impetiginosus* (lapacho rosado), *Sorocea sprucei* (maría molle), *Copaifera langsdorffii* (kupa'y), *Machaerium hirtum*, *Astronium fraxinifolium* var. *glabrum* (urunde'y para moroti), *Anadenanthera peregrina* (kurupa'y ita), *Aspidosperma quebracho-blanco* (quebracho blanco), *Sideroxylon obtusifolium* (guajayvi rai), *Ocotea diospyrifolia* (aju'y sa'yju), *Cereus stenogonus* (tuna). Los arbolitos y arbustos presentes son *Randia* spp. (ñuati kurusu), *Myrsine* sp. (kanelón), *Genipa americana* (ñandypa guasu), *Monteverdia ilicifolia* (kangorosa), *Casearia sylvestris* (burro ka'a), *Tabernaemontana catharinensis* (sapiranguy), *Tocoyena formosa*, *Psidium* spp., *Cestrum* sp., *Trichilia stellato-tomentosa*, *Celtis* sp. (juasy'y), *Xylosma venosa* (ñuati pyta), *Melochia* sp., *Scleria* sp. Entre las lianas se citan a *Forsteronia glabrescens* y *F. pubescens* (ysypo kamby), *Paullinia pinnata*, *Smilax* sp., *Tanaecium* sp., *Bonamia* aff. *subsessilis*, *Janusia guaranitica*, *Smilax* sp., *Passiflora cincinnata* (mburucuja), entre otros. Los bordes generalmente se encuentran colonizados por *Bromelia balansae* (karaguata) y *Stachytarpheta cayennensis* (tatu ruguai).

Final report.

FLOODED SAVANNA WITH “EMBALSADO” (SIn)

Flooded savanna with “embalsado”. Zapallo. 30.03.2021. Lidia Pérez de Molas.

Constituye un gran humedal caracterizado por la dominancia de pocas especies, entre ellas Cyperaceae y Fabaceae, principalmente *Aeschynomene* aff. *americana* creciendo en forma aislada. Tiene agua permanente y un sustrato orgánico que produce movimiento al caminar encima. Algunas especies registradas además son: *Eleocharis* spp.; *Utricularia* spp., *Hibiscus sororius*, *Ludwigia nervosa*, *Nymphoides indica*, *Pontederia* aff. *subovata*.

EMBALSADO

Embalsado en Sabana Inundada. Zapallo. 30.03.2021. Lidia Pérez de Molas.

Insertos en algunos pocos sectores se encuentran embalsados de unos 10 hasta 15 metros de diámetro, colonizados principalmente por leñosas de las familias Onagraceae, Fabaceae y Malvaceae. Algunas especies registradas son *Habenaria* aff. *repens*, *Mayaca sellowiana*, *Myrsine* sp., *Cecropia pachystachya* (amba'y), *Bacopa* aff. *salzmannii*, Pteridophyta, Melastomataceae, *Xyris* sp., *Hydrolea* aff. *spinosa* var. *paraguayensis*.

AQUATIC VEGETATION IN WATER BODIES

Laguna. Zapallo. 29.03.2021. Lidia Pérez de Molas.

En los cuerpos de agua de variable dimensión y profundidad, y dispersos en todos los sitios de estudio, establecidos para consumo del ganado principalmente, se desarrolla la vegetación acuática-palustre, entre las que se citan a las anfibias, enraizadas en el fondo y las flotantes libres. Algunas especies registradas son: *Eleocharis* spp., *Pontederia azurea* (aguape), *Nymphoides indica*, *Limnocharis flava*, *Hydrocleys nymphoides*, *Ludwigia nervosa*, *Gymnocoronis spilantoides*, *Marsilea* sp.. En los bordes se desarrollan poblaciones casi puras de *Polygonum* spp., entre otros.

Methodology of work in field campaign

Ref.: A: Coordination among different taxonomic teams, B: Pre-processing of botanical sampling, C: Exchange and coordination with PARACEL technicians; D y E: Information gathering in sampling stations (EM)

The islets of forests

Islets present in plant formations, mainly in the Floodable Savannah (SI), are characterized by occupying the highest portions of the land and with a biodiversity represented by around 70 species of vascular plants that include Pteridophytes, Monocotyledons and Dicotyledons. In these formations there are herbs, shrubs, trees, vines and succulents such as the Cactaceae, the majority of terrestrial habits, and also some epiphytes. The edge of the islets is generally colonized by Bromeliaceae and Poaceas. Several of the species recorded on the islets are not present in the other plant formations, therefore their flora constitutes a rich contribution to the general biodiversity of the study area.

The islets are diverse in shape, size, biodiversity and distance from one another. In all cases, one or more anthills have been registered in them, and also termitehills (locally known as *takuru*), depending on the size of the islet. These anthills and *takuru* also always have holes that possibly serve as places of refuge for snakes, birds, rodents, and even wasps, bees and spiders. It is possible that the evolution of these forest islets exists in an association of ants and termites, which, by affecting the structure of the soil, allow organic matter to be carried to the depths and bring more infertile soil to the surface. This would facilitate the appearance of tree species with deeper roots, which would change the structure of the soil to facilitate the evolution of the islets.

Likewise, the islets would also serve as a resting place, roosting, feeding, nesting and socialization of certain species of birds and mammals. In addition, the scattered structure between grassland and savanna areas allows the arrangement of patches in the landscape, increasing the possibility of habitats for greater richness. These islets form the true structure of the "stepping stones".

The islets are therefore floristically and structurally functional parts of the vegetation mosaic, where the Floodplain is the main matrix and they are subjected to environmental conditions such as floods, droughts, fires and trampling of animals. Their importance lies in the fact that they are fundamental pieces that contribute to the stability and general connectivity of the system.

Ornithology

Sampling sites for the ornithological sampling and natural communities

The ornithological sampling areas included several sites, the sites correspond to natural communities. Natural communities were identified in order to assess the richness and abundance of birds. In all the sampling areas, Riparian Forests (BR) were evaluated, in three of them Degraded High Forests (BA), while Floodable Savanna (SI), High Savanna (SA) and Aquatic Vegetation (VA), in addition to the Cerrado phytofisionomies, such as Campo Cerrado (CC) and Cerradón (CD).

Sampling areas	Natural community / plant formation		Coordinates
Gavilán	BA	Bosque Alto degradado	22°40'20,3"S; 56°53'44,7"W
	BR	Bosque ribereño o marginal	22°40'03,1"S; 56°53'44,3"W

Final report.

Species of high conservation interest

Entre las registradas, se identifican seis de especial interés para la conservación. Se describen brevemente aspectos ecológicos siguiendo a Parera (2017) y Canevari y Vaccaro (2007), sus situaciones de conservación actual y principales amenazas (IUCN 2021; APM y SEAM 2017).

■ *Panthera onca* or jaguar

Es el felino más grande del continente americano, de hábitos solitarios y principalmente nocturnos, aunque también puede estar activo de día. Muy territoriales (dejan marcas en los troncos de los árboles y deposiciones para marcar su territorio). Rango de acción entre 10 y más de 300 km², según la disponibilidad de recursos. Habitán gran variedad de ambientes entre bosques secos y húmedos, pastizales, sabanas, etc. Son los predadores tope de la red trófica terrestre en el neotrópico. Presas: pecaríes, carpinchos, pecas, agutíes, armadillos, taires, monos, corzuelas, garzas, cigüeñas, pavas de monte, otros carnívoros como ocelotes o zorros, e incluso animales domésticos como perros y el ganado. Su reproducción puede ocurrir a lo largo del año, en Paraguay es más frecuente que los nacimientos ocurran entre noviembre y enero. (gestación entre 90 y 110 días, camada de 1 a 4 individuos). El cuidado de las crías lo realiza exclusivamente la hembra, la lactancia se prolonga hasta un semestre y las crías permanecen junto a la madre hasta los 2 años de edad.

La tendencia poblacional de esta especie es decreciente y la distribución histórica de la especie se ha reducido en diferentes partes dando lugar a extinciones locales. En el país sus principales amenazas son la pérdida de hábitat debido al cambio de uso de suelo, la cacería y los conflictos con humanos debido a la predación de ganado.

■ *Leopardus pardalis* or ocelot

Felino manchado mediano de cuerpo compacto, cola corta y extremidades robustas. Es fundamentalmente nocturno, aunque en zonas sin alteración antrópica también se muestra activo durante el día. Vive en ambientes con buena cobertura vegetal (bosques húmedos o secos), o en estepas arbustivas. Su área de acción es variable dependiendo del tipo de ambiente; las hembras pueden abarcar unos 11 km², mientras que los machos hasta 18 km². Se alimenta de mamíferos más pequeños, aves, reptiles anfibios e incluso peces, entre sus presas se puede citar a los agutíes, comadrejas, conejos, lagartijas y pequeñas tortugas. No presenta estacionalidad reproductiva, generalmente tiene 1 o 2 crías por camada. Tendencia poblacional decreciente, en el país se encuentra en categoría de Casi Amenazada. Principales amenazas: pérdida de hábitat y caza furtiva para la comercialización de su piel.

■ *Chrysocyon brachyurus* or maned wolf

Es el cánido de mayor tamaño en Sudamérica, con patas negras muy largas, el resto del pelaje rojizo y una crin sobre el cuello y los hombros. Es básicamente nocturno y crepuscular, muy raro de observar durante el día. De hábitos solitarios aunque también puede vivir en pareja. El rango de acción es de aproximadamente 30 km². Su dieta es omnívora, y se alimenta principalmente de roedores pequeños, frutos e insectos, aunque también se alimenta de aves, armadillos, reptiles, anfibios, peces y cangrejos. La reproducción se produce una vez al año entre abril y junio. La gestación dura un poco más de dos meses y la camada tiene entre 1 a 5 crías.

Tendencia poblacional desconocida a escala internacional, sin embargo, en Paraguay su población ha disminuido al menos en un 30% como resultado de la pérdida y la degradación de hábitat. Amenazas:

atropellamientos, cacería por conflictos con humanos por la predación de aves de corral, enfermedades adquiridas por contacto con especies domésticas.

■ *Myrmecophaga tridactyla* or giant anteater

Edentado de larga trompa y lengua, con pelaje duro y largo, con una coloración característica con base negra y una línea blanca que cruza por los flancos hasta el dorso. De hábitos solitarios y catemerales, se lo encuentra principalmente en áreas abiertas como pastizales y sabanas arboladas, aunque también habita bosques secos y húmedos. Su área de acción varía entre 3 a 9 km² y se alimenta exclusivamente de termitas. Su reproducción puede ocurrir a lo largo del año. El periodo de gestación dura un poco más de 6 meses, luego del cual nace una sola cría. La lactancia dura alrededor de 7 meses. Tendencia poblacional decreciente y en Paraguay se estima que su tamaño poblacional disminuyó en un 30%. Amenazas: pérdida de su hábitat, los incendios, el atropellamiento en rutas y la caza ilegal.

■ *Tapirus terrestris* or tapir

El mamífero terrestre sudamericano de mayor tamaño. Considerado un ingeniero del ecosistema ya que modifica los ambientes que habita abriendo caminos entre la vegetación. Habita selvas tropicales y subtropicales, selvas en galería y bosques chaqueños. Es generalmente solitario y fundamentalmente nocturno, aunque también puede estar activo durante el día. Su área de acción es de 40 a 65 km², aunque varios individuos pueden compartir la misma área. Su época reproductiva está aparentemente relacionada con las lluvias. La gestación dura entre 13 a 14 meses, luego de la cual nace una sola cría.

Tendencia poblacional decreciente, se observó una disminución muy importante de su tamaño poblacional en el país, principalmente en la Región Oriental, donde se estima que la disminución fue de un 90%. Amenazas: pérdida y degradación de su hábitat, la cacería furtiva y la caza para consumo, así como las obras viales de gran tamaño.

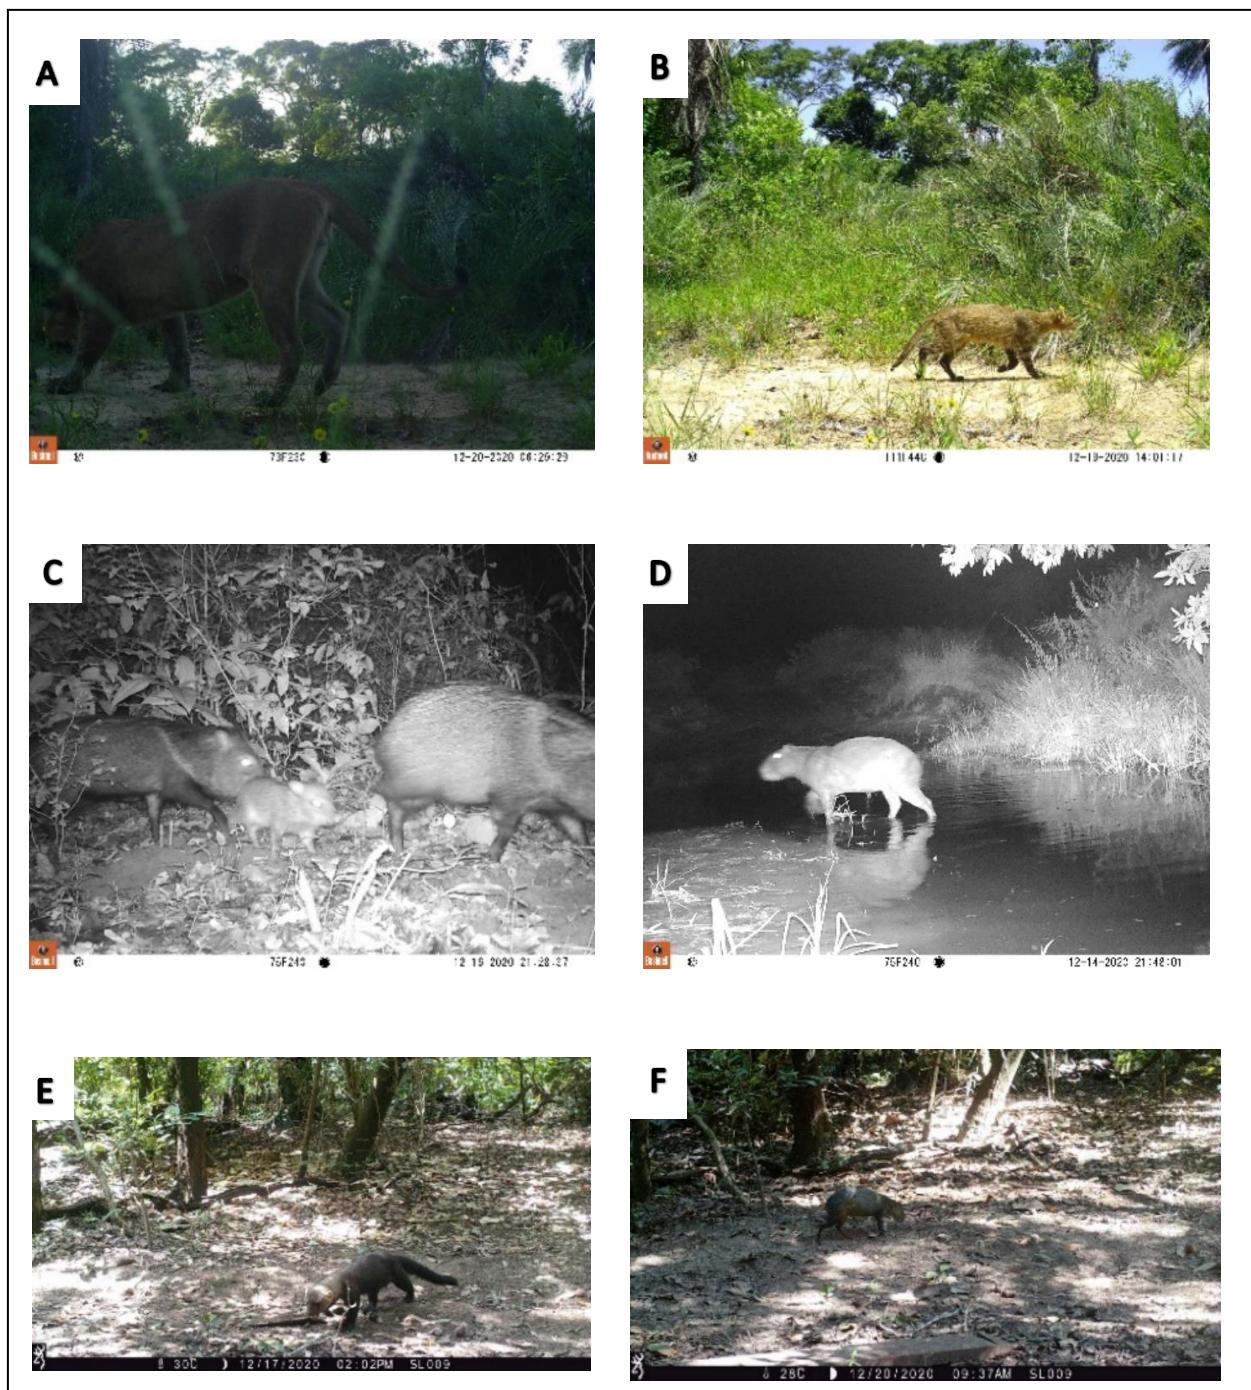

■ *Tayassu pecari* or White-lipped peccary

Es el pecarí de coloración más oscura y se caracteriza por tener el mentón blanco, lo que le da el nombre común en español. Es gregario, formando grandes piaras o grupos de numerosos individuos cuyo tamaño puede variar entre 15 a cientos de individuos. Habita selvas tropicales y subtropicales, bosques secos y húmedos y sabanas. Son nómadas, se desplazan por un amplio territorio según la disponibilidad de recursos. Se alimenta de frutos, semillas, flores, hojas, raíces, hongos, gusanos, ranas, ofidios, y hasta pequeños mamíferos. Los nacimientos pueden ocurrir todo el año, la gestación dura entre 5 a 6 meses, luego de la cual nacen 1 a 4 crías (frecuentemente 2)

Tendencia poblacional es decreciente, y en el país los datos sugieren una disminución importante a ambos lados del Río Paraguay. Amenazas: pérdida y degradación del hábitat, la cacería furtiva y de consumo, y el avance de la frontera humana sobre áreas silvestres cacería.

Other species identified

During fieldwork in December 2020 and March-April 2021, there was the opportunity to record other species beyond the focus taxa of the diversity baseline study, including fungi and invertebrates.

Fungi species recorded

In the case of fungi, 40 species of the great variety of existing fungi could be identified.

Final report.

M. *Amanita* sp. **N.** *Ganoderma* cfr. *australe*. **O.** *Dacryopinax* cfr. *spathularia*.

Invertebrates

In the case of invertebrates, there are a large number of species and we only focus here on those species for which a photographic record could be achieved. Among them, the diversity of arachnids appears to be high; however, the main record has to do with a tarantula from the Theraphosidae family, probably *Acanthoscurria* sp. On the other hand, *Callonotacris caeruleipennis* (grasshoppers) is a species that was recently registered for Paraguay in the San Luis NP, there is only a known record for the Cerrado ecoregion in the Department of Concepción. During this survey it was recorded and photographed in the closed field (CC).

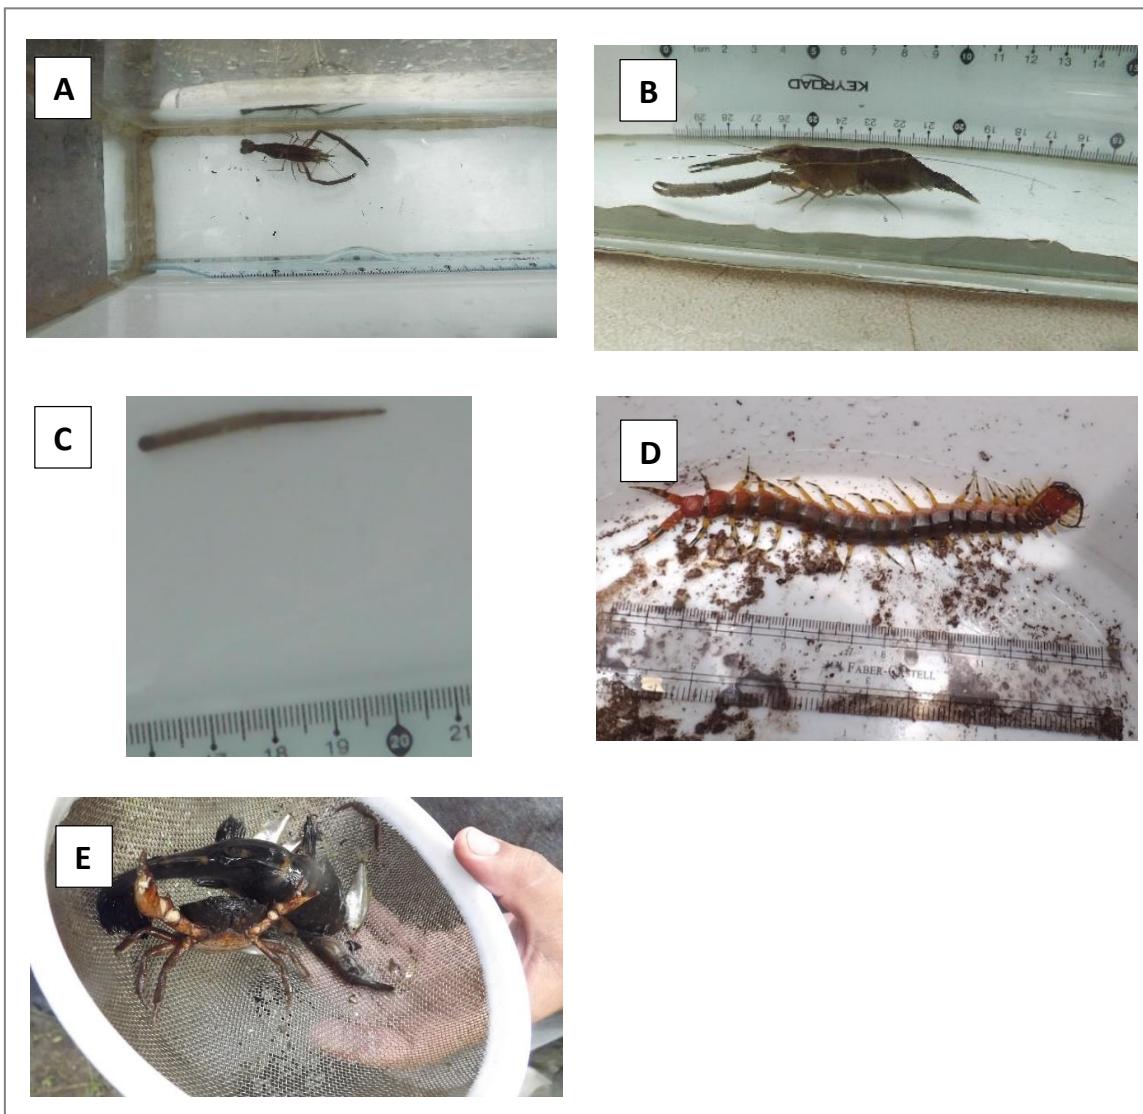

Final report.

Biodiversity Baseline Study of Paracel Properties. Paracel S.A.
May 2021.

Ref. A) Tarantula of Theraphosidae family (Diego Bueno); B) *Callonotacris caeruleipennis*

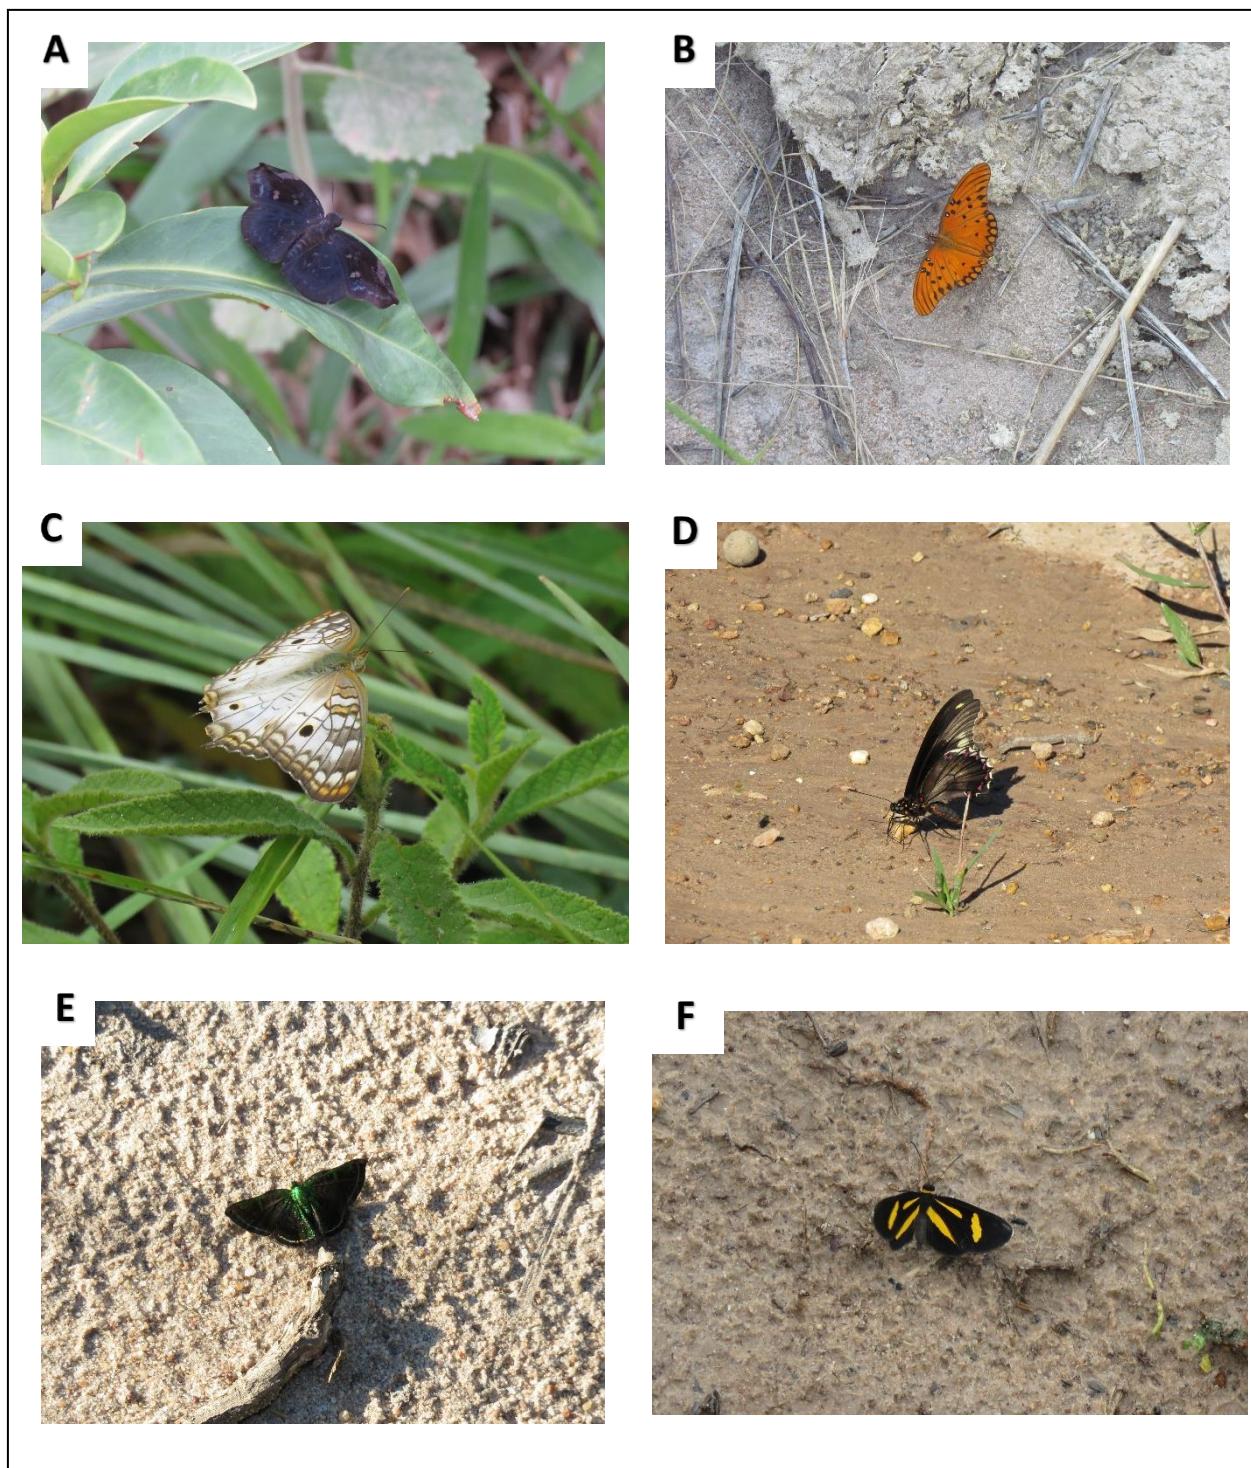

Other organisms photographed and identified were those that are presented below, such as palemonids or freshwater shrimp, the scolopendra (myriapod also known as centipedes), the leech (hirudineus) and the trichodactyl or decapod crustacean (next to the fish) that are exemplified with the photos.

In the same way, a small sample of 12 species of butterflies or Lepidoptera were recorded and are shown in this document.

Ref.: A y B) Palemonids (freshwater shrimps); C) Hirudíneo (leech); D) Escolopendra (miriápod); E) Tricodáctilo (decapod crustacean)

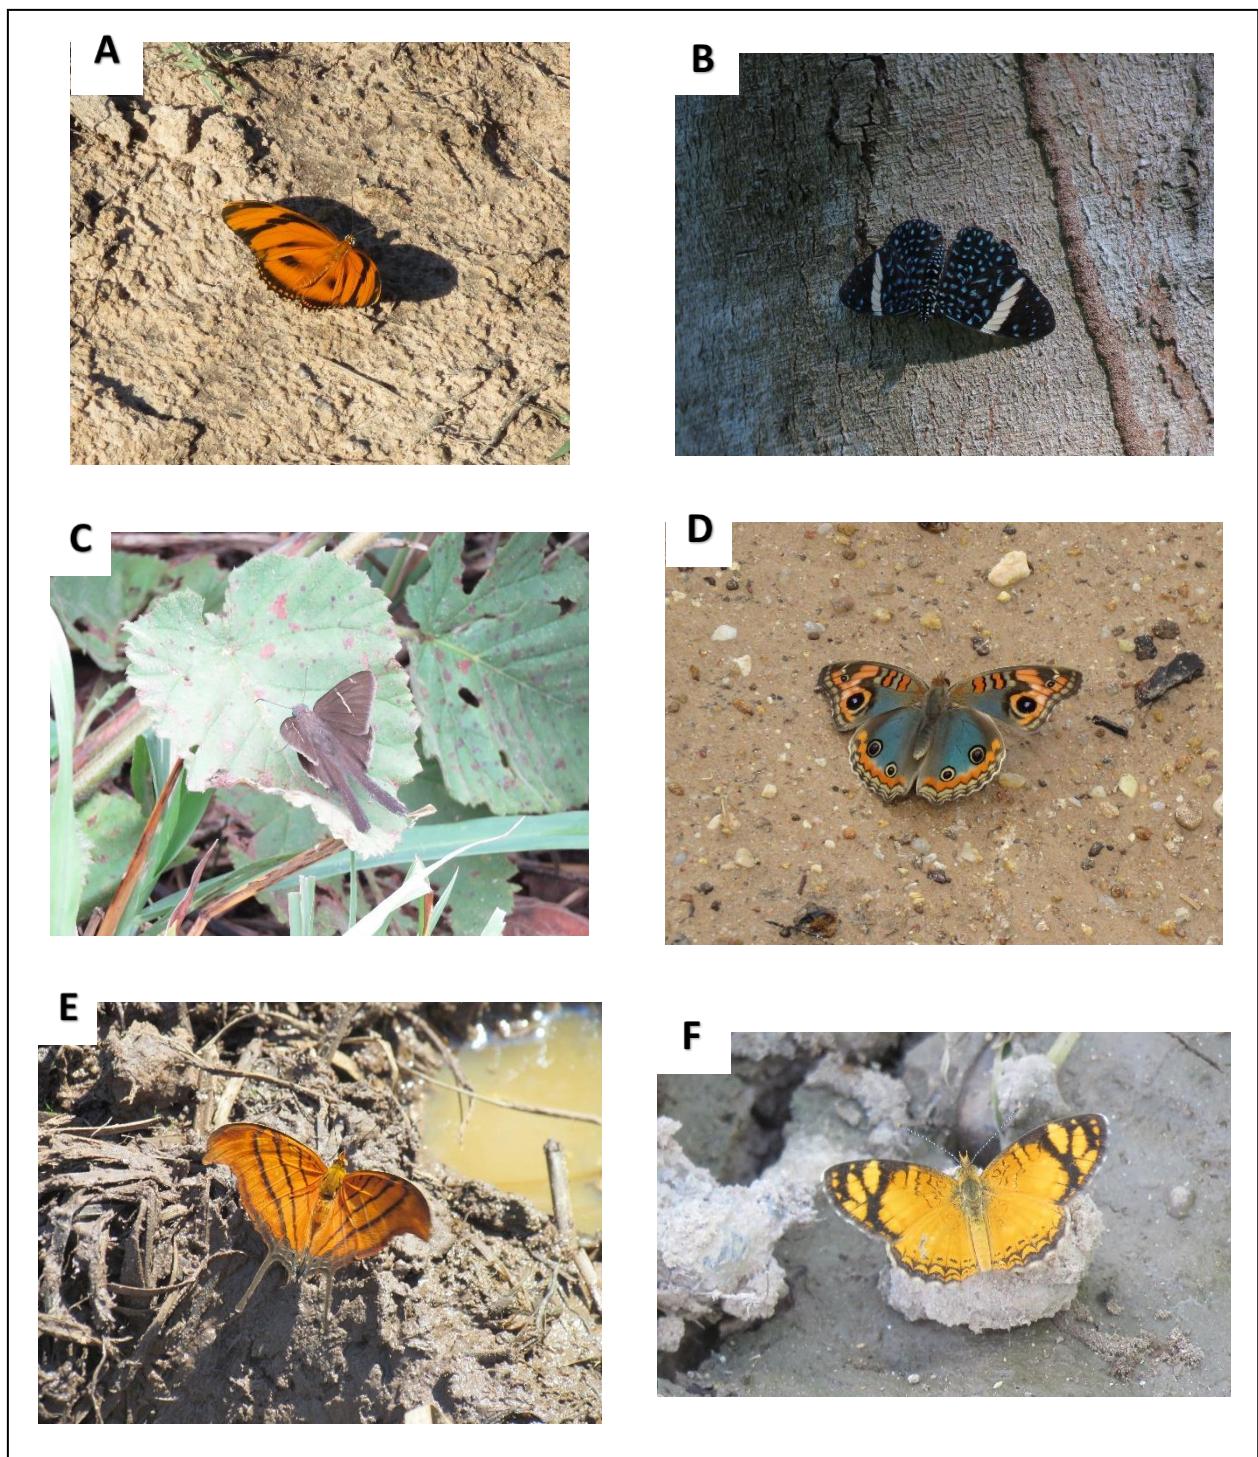

Final report.

Photographs of some butterflies recorded. Ref.: A) *Achlyodes mithridates*, B) *Agraulis vanillae*, C) *Anartia jatrophae*, D) *Battus polydamas*, E) *Caria marsyas*, F) *Chamaelimnas briola meridionalis*. Fotos: Nicolás Cantero (A, C, D, E y F) y Rebeca Irala (B).

ANEXO 1: Herramientas utilizadas para el relevamiento de información

- Entrevista a referentes de Estancias
- Encuesta de Percepción Social
- Entrevista grupal
- Entrevista a informantes claves

Con el objetivo de acceder a información necesaria para estudios sociales previos a la implementación del proyecto "*Construcción y Operación de una Planta de Celulosa en Concepción*"; resulta de especial interés conocer algunos elementos para la caracterización de la zona de influencia y la percepción con respecto al proyecto. Para el efecto se realizan entrevistas a actores claves a nivel comunitario e institucional como ser: referentes de salud, educación, organizaciones sociales, comités productivos y a responsables o encargados de los establecimientos que serán destinados a las plantaciones forestales.

En este sentido, agradecemos su participación y garantizamos la privacidad de los datos aportados.

1. DATOS DE LOS ENTREVISTADOS

Nombre y Apellido	
Edad	
Cargo	
Tiempo que lleva trabajando en la estancia	
Número de Teléfono	

2. DATOS DEL ESTABLECIMIENTO

2.1 Nombre de la Estancia

--

2.2 ¿Podría señalar cuáles son los rubros principales a los que se dedican en el establecimiento? Ej. Ganadería, agricultura, otros.

2.3 ¿Son propietarios o arrendatarios?

2.4 ¿Cantidad de hectáreas que posee la propiedad?

2.5 En caso de ser arrendatario especificar ¿cuántas hectáreas son utilizadas?

2.6 ¿Desde hace cuántos años que están en el lugar?

2.7 ¿Cuántas personas son empleadas de forma en la estancia? Además, ¿Podría especificar la cantidad de mujeres y varones?

Total de empleados	
Total de empleados Varones	
Total de Empleadas Mujeres	

2.7.1 ¿A qué se dedican principalmente estas personas? Ej. Capataces, tractoristas, veterinarios, otros.

2.7.2 ¿De qué distritos o localidades provienen principalmente?

2.8 Podría estimar en términos de un año ¿cuántas personas son contratadas para trabajos puntuales en la estancia? Es decir, cuántos no son empleados fijos.

2.8.1 ¿A qué se dedican principalmente las personas que no son empleados fijos de la estancia?

2.8.2 ¿De qué distritos o localidades provienen principalmente?

3. PERCEPCION SOCIAL RESPECTO AL PROYECTO

3.1 ¿Usted tiene conocimiento sobre la posible instalación de una planta de celulosa en Concepción?

3.2 ¿Considera que este emprendimiento es positivo a nivel departamental, distrital y local? Sí / No

3.2.1 Por qué:

3.3 Algunas sugerencias o recomendaciones para el proyecto

**PROYECTO DE CONSTRUCCIÓN Y OPERACIÓN DE LA PLANTA DE

Entrevista grupal

3.1 Cuestionario para relevamiento de información

Entrevista Grupal (actores comunitarios)

1. Información Básica

Departamento:	Distrito:	Localidad:	Fecha:
Sede			
Cantidad de participantes	Hombres:	Mujeres:	Total:
Breve descripción del Grupo	Lugares-Referentes		

2. Elementos para tener en cuenta

Realizar una breve introducción dando el marco de realización del grupo focal, resaltando la importancia de acceder a información respecto a características de la zona involucrada y la percepción de los presentes sobre el proyecto.

- Presentación del Proyecto.
 - Espacio de preguntas aclaratorias.
 - Antes de la finalización del grupo focal se entrega encuestas a cada participante
 - Guía de preguntas claves relacionadas a aspectos socioeconómicos relevantes respecto a la zona:
3. ¿Cuáles son las principales actividades económicas de la zona?
 4. ¿Qué aspectos positivos pueden mencionar de la zona?
 5. ¿Qué problemas de índole social, económico y cultural pueden mencionar de la zona?
 6. ¿Cuáles son los aspectos que consideran necesarios de ser trabajados en su distrito/departamento para un mayor desarrollo?
 7. ¿Qué planes y proyectos de desarrollo existen y son importantes de considerar?
 8. ¿Qué medios/espacios de comunicación/participación son los más utilizados para compartir información en el distrito/localidad?
 9. ¿Existen organizaciones, asociaciones, etc.? tipo (ejemplo: comisiones vecinales, comités productivos, nucleaciones juveniles, gremiales, religiosas, etc.)
 10. ¿Qué tipo eventos existen en la zona? (tormentas, granizadas, incendios, inundaciones, etc.)

Caracterización de cada Distrito AID

Para la elaboración de la presente sección se acudió a fuentes oficiales, tanto a nivel nacional como local respecto a las características sociales, demográficas, económicas y culturales de cada uno de los distritos que conforman el AID del proyecto en su componente forestal. Asimismo, y al no contar con información de esta índole a nivel de localidades, se utilizaron datos cualitativos resultantes del relevamiento en campo (fuentes primarias).

La información fue organizada en subcapítulos por temas de interés, agrupada por distritos y a fin de presentar los datos resultantes del trabajo de campo, fueron elaboradas fichas descriptivas de las localidades involucradas al relevamiento; estas se encuentran en el anexo nro. 4.

Para contar con fuentes actuales, se procedió a la búsqueda y solicitud de datos oficiales a instituciones del nivel nacional, responsables de dicha información, por lo cual, la caracterización aquí presentada está basada en su totalidad en datos de:

- Información oficial proveída por instituciones nacionales como la DGEEC, MAG e INFONA, así como información resultante de la búsqueda en fuentes generadas por el MEC, MOPC, MSPyBS, entre otros.
- Información de nivel local identificada en planes locales de salud y planes municipales de desarrollo.

En cuanto a los datos estadísticos utilizados, se debe considerar que:

- Si bien cierto tipo de información solo pudo ser obtenida de los diferentes Censos realizados: Censo Nacional (2012), Censo Agropecuario (2008), Censo Económico (2011), a través de la Encuesta Permanente de Hogares pudo complementarse dicha información.
- El departamento de Concepción ha pasado por varios desmembramientos en los últimos años, por lo cual cierto tipo de información podría mostrar variaciones según el periodo de elaboración del mismo, sobre todo en el caso de los distritos de Horqueta y San Alfredo.
- En términos de proyecciones de población y datos relacionados, se priorizó la utilización de la información facilitada por la DGEEC correspondiente al periodo 2020-2025.

Para la lectura e interpretación de los datos facilitados por la DGEEC, se realizan las siguientes aclaraciones:

- El Censo Nacional de Población y Viviendas 2012 tuvo una cobertura poblacional aproximada del 74,4% a nivel país; que resulta de comparar la población censada con la población estimada para 2012.
- El departamento de Concepción tuvo una cobertura de 80,8%; y sus distritos: Horqueta 80,6%; Loreto 80,4%; Sargento José Félix López 80,6%; San Alfredo 68,4% y Paso Barreto 95,2%.
- En términos de viviendas, la cobertura fue del 87,1% a nivel nacional; que resulta de la relación de la cantidad de viviendas censadas en el 2012 respecto a la cantidad de viviendas pre-censadas (1.223.165 y 1.404.121 viviendas, respectivamente). El departamento de Concepción tuvo una cobertura de 93,3%; y sus distritos: Horqueta 92,5%; Loreto 92,5% y Sargento José Félix López 89,5%.

En cuanto a Necesidades Básicas Insatisfechas (NBI) se presentan las siguientes explicaciones:

- **NBI en calidad de la vivienda:** 1. *El material utilizado en la construcción es:* Área urbana: Piso de tierra y pared de madera, estaqueo, adobe, tronco de palma, cartón, hule, madera de embalaje, otros, o no tiene pared, y techo de paja, tronco de palma, cartón, hule, madera de embalaje u otro. Área rural: Piso de tierra y pared de estaqueo, adobe, tronco de palma, cartón, hule, madera de embalaje, otros, o no tiene pared, y techo de paja, tronco de palma, cartón, hule, madera de embalaje u otro. 2. *Hacinamiento:* Si registran más de 3 personas por dormitorio.
- **NBI en infraestructura sanitaria:** 3. *Disponibilidad de agua:* Área urbana: Si el agua proviene de ESSAP (ex CORPOSANA), Junta de saneamiento (SENASA), red comunitaria, red privada, pozo artesiano o pozo con brocal y tapa, y llega a la vivienda a través de canilla pública, vecino, aguatero móvil u otros medios, o si proviene de pozo sin brocal y/o tapa, manantial/ycuá, aljibe, aguatero móvil, agua superficial (río, represa, lago, estanque, arroyo, tajamar, canal, etc.) u otra fuente. Área rural: Si el agua proviene de ESSAP (ex CORPOSANA), Junta de saneamiento (SENASA), red comunitaria, red privada, pozo artesiano o pozo con brocal y tapa, y llega a la vivienda a través de canilla pública, vecino, aguatero móvil u otros medios, o si proviene de pozo sin brocal y/o tapa, manantial/ycuá, aljibe, aguatero móvil, agua superficial (río, represa, lago, estanque, arroyo, tajamar, canal, etc.) u otra fuente. 4. *Eliminación de excretas:* Área urbana: Si posee letrina común, desagüe de baño en la superficie de la tierra, arroyo, río, etc., o no tiene servicio sanitario. Área rural: Si posee baño con desagüe en la superficie de la tierra, arroyo, río, etc., o no tiene servicio sanitario.
- **NBI acceso a la educación:** 5. *Asistencia escolar de niños:* Si existe algún niño de 6 a 14 años, emparentado con el jefe de hogar, que no asiste a un establecimiento educativo (se excluye al servicio doméstico y / o los familiares de éstos). 6. *Analfabetismo:* Si existe alguna persona analfabeta (de 15 años o más que en el momento del Censo 2012 no tenía el segundo grado aprobado) emparentada con el jefe de hogar (se excluye al servicio doméstico y / o los familiares de éstos).
- **NBI en capacidad de subsistencia:** 7. *Capacidad de Subsistencia:* Si carece de perceptor (persona ocupada, jubilada, pensionada o rentista) o si el jefe cuenta con una educación inferior a 3 años de educación primaria, y con más de 3 personas en promedio por cada percepto.

1. Distrito de San Alfredo

1.1 Características generales

San Alfredo es un municipio del departamento de Concepción, ubicado a 494 km de la capital del país y a 78 km al norte de la capital departamental. Tiene una extensión de 2392 km². Limita al norte con el distrito de San Lázaro, al sur con el distrito de Concepción, al este con los distritos Paso Barreto y San Carlos; y al Oeste con el Departamento de Presidente Hayes de la Región Occidental (Chaco). Su distritación data del año 2013, anteriormente formaba parte del distrito de Concepción y era denominada como “Colonia San Alfredo”.

Acceso a San Alfredo a través de la ruta asfaltada a San Lázaro (Vallemi)

Fuente: Radio Regional 660 AM (2019).¹

En el Plan Local de Salud se expone que pobladores antiguos comentaron que 100 años atrás el territorio estaba conformado solo por establecimientos ganaderos pertenecientes al Estado y establecimientos privados de explotación forestal cuyos productos eran trasladados a Argentina por el río Paraguay. En cuanto a los primeros pobladores, se sostiene que ocuparon una fracción de la Estancia San Fernando, siendo posteriormente desalojados, lo que les obligó a vivir en chozas provisionales de dicha zona (monte fiscal), creando luego la Colonia San Alfredo, con lotes de 7 hasta 22 hectáreas.

En ese entonces, en San Alfredo se dedicaban a la producción de maíz, mandioca, almidón, tabaco, cítricos, cebolla, locote, tártago y caña de azúcar. “Estos productos eran trasladados en carros y comercializados en el distrito de Concepción; con el ingreso adquirían vestimentas y herramientas de trabajo”².

Otros datos presentados en la fuente de consulta respecto a su historia son:

- En el año 1936 se construyó la primera escuela con la colaboración de los pobladores.
- Las primeras autoridades fueron denominadas Sargentos de Compañía, designados por la Delegación de Gobierno del Departamento de Concepción. En 1968 se construyó la Comisaría Local.
- En 1980 comenzó la construcción de la actual Escuela Laguna Ybycua y posteriormente el Colegio del mismo nombre.

1.2. Datos de Población

Según datos de la Dirección General de Estadística, Encuestas y Censo (DGEEC), la población total del departamento de Concepción es de 254.976 habitantes, perteneciendo al Distrito de San Alfredo 5.799 habitantes. Esta totalidad representa el 2,27% del departamento. San Alfredo está conformado por 3.275 hombres y 2.524 mujeres (Proyección 2020)³. Como se puede observar en la siguiente tabla, en su mayoría, es decir, el 56,48% de la población del distrito está conformada por hombres y el 43,52% por mujeres.

Tabla 1. Proyección de la población total por sexo, según distrito. Año 2020

Distrito San Alfredo	Población	Porcentajes
Hombres	3.275	56,48
Mujeres	2.524	43,52
Total (ambos sexos)	5.799	100
% Población Total del Distrito según total del departamento.	254.976	2,27

Fuente: Elaboración propia en base a datos de la DGEEC. Dpto. Concepción. Población estimada y proyectada, según distrito, sexo y grupos de edad, 2000-2025

Como puede observarse en la siguiente tabla sobre proyecciones de evolución / crecimiento de la población, la diferencia en la relación cantidad hombres /mujeres (mayoría hombres) se ha mantenido en los últimos en 5 años.

Tabla 2-a. Evolución de la población en los últimos 5 años (2016-2020)

Distrito San Alfredo Población por sexo	Año				
	2016	2017	2018	2019	2020
Hombres	2.918	3.005	3.093	3.183	3.275
Mujeres	2.361	2.401	2.441	2.482	2.524
Población total	5.279	5.405	5.534	5.665	5.799

Fuente: DGEEC. Dpto. Concepción. Población estimada y proyectada, según distrito, sexo y grupos de edad, 2000-2025

Los siguientes datos de proyección de la población fueron proveídos por la DGEEC, en el marco de elaboración del presente informe. Se debe hacer la salvedad de que existe variación respecto a los datos publicados, debido a las distritaciones que fueron llevadas a cabo de manera posterior a la realización del censo. Como se puede observar en la siguiente tabla, existe una disminución de la población para el Distrito de San Alfredo en relación a lo proyectado en la tabla anterior para el año 2020.

Tabla 3-b. Evolución de la población en los siguientes 5 años (2020-2025)

Departamento y distrito	Año					
	2020	2021	2022	2023	2024	2025
Dpto. Concepción	254.976	258.653	62.360	266.072	269.805	273.579
San Alfredo	4.989	5.070	5.151	5.233	5.315	5.398

Fuente: STP/DGEEC. Paraguay. Proyección de la población por sexo y edad, según distrito, 2000-2025. Revisión 2015

El distrito de San Alfredo, según datos señalados en el Plan Local de Salud, se divide de la siguiente manera:

³ DGEEC. Dpto. Concepción. Población estimada y proyectada, según distrito, sexo y grupos de edad, 2000-2025

- **Zona urbana** que incluye a 10 barrios como: Centro Norte, Costa Florida, Santa Teresita, Chaco'i, Mangoty, La Amistad, San Ramón, Centro Sur, María Auxiliadora y Santa Lucia; y
- **Zona rural**, conformada por 6 compañías tales como: Tres Cerros, Itakua, Puerto Fonciere, Guyrati, Peña Hermosa e Itapucumí.

En la Compañía Guyrati se encuentra una **comunidad indígena** perteneciente al Pueblo Originario Anga'ite, integrada por 13 familias y 2 asentamientos (8 de Noviembre y Paz y Alegría).

Escuela de Guyratí – San Alfredo

Hogares, vivienda

Con relación a la condición de propiedad de la vivienda, según datos brindados por la DGEEC⁴, en el distrito de San Alfredo, el mayor porcentaje corresponde a viviendas propias, dándose en menor proporción otras condiciones de propiedad como “alquilada”, “en condominio”, “prestada”, entre otras. Esto se señala en la siguiente tabla.

Tabla 4. Condición de propiedad de la vivienda

Condición de propiedad de la vivienda	Departamento de Concepción	Distrito de San Alfredo
Viviendas particulares ocupadas con personas presentes	42.402	966
% Es propia	85,2	82,0
% La están pagando en cuotas	0,9	-
% Es en condominio	0,4	0,4
% Es alquilada	5,1	1,7
% Es prestada, la cuidan	7,5	15,3
% Es ocupada de hecho	0,8	0,5
% No informado	0,1	0,1

Fuente: STP/DGEEC. Censo Nacional de Población y Viviendas, 2012.

Necesidades Básicas Insatisfechas (NBI)

En cuanto a las NBI en la zona de influencia Directa del proyecto, se accedió a información proveída por la DGEEC⁵, referente al distrito de San Alfredo en relación a la situación tanto a nivel país como

⁴ Datos solicitados y proveídos por la DGEEC. Sep. 2020.

⁵ DGEEC. Necesidades Básicas Insatisfechas (NBI) 2012 PARAGUAY. Disponible en: <https://www.dgeec.gov.py/Publicaciones/Biblioteca/investigacion%20tematica/Triptico-de-necesidades-insatisfechas-NBI-2012.pdf> y

del departamento, indicando que en el 49,1% de los hogares del mismo se tiene al menos una NBI, el 24,5% corresponde a Hogares con NBI en acceso a la educación, el 21,5% a hogares con NBI en infraestructura sanitaria, el 19,0% a hogares con NBI en calidad de la vivienda y el 12,5% a los Hogares con NBI en capacidad de subsistencia, como puede observarse en la tabla 5.

Tabla 5. Hogares con NBI, según departamento y distrito

Indicadores de Necesidades Básicas Insatisfechas (NBI) (%)	Total País	Departamento de Concepción	Distrito de San Alfredo
Hogares particulares ocupados con personas presentes	1.232.496	42.638	967
% Hogares con al menos una NBI	43,0	56,2	49,1
% Hogares con NBI en calidad de la vivienda	12,6	19,0	19,0
% Hogares con NBI en infraestructura sanitaria	20,8	29,7	21,5
% Hogares con NBI en acceso a la educación	15,7	20,3	24,5
% Hogares con NBI en capacidad de subsistencia	14,9	19,8	12,5

1.3. Economía

Los datos del Plan Local de Salud con relación a la economía exponen que se basa eminentemente en la explotación forestal, agrícola y ganadera. Sus habitantes se dedican también a la explotación minera y calera, y al comercio. Las fuentes de empleo constituyen además las instituciones públicas y privadas, estancias, aserraderos, entre otros. Los pobladores que viven en las zonas ribereñas como Itakua, Guyrati, Itapukumi se dedican a la caza y a la pesca⁶.

Actividades económicas

Según los datos proveídos por la DGEEC⁷, en el Distrito de San Alfredo predominan las actividades productivas vinculadas al sector primario, posteriormente las del sector secundario y en menor proporción las vinculadas al sector terciario. La siguiente tabla incluye los porcentajes de cada sector en el distrito y a nivel departamental.

Tabla 6. Población ocupada por sector económico

Datos de Población	Departamento de Concepción	Distrito de San Alfredo
Sector económico de la población ocupada ⁸	226.585	4.800
% Primario	40,9	48,9
% Secundario	15,7	30,1
% Terciario	42,2	18,9
% No informado	1,2	2,1

Fuente: STP/DGEEC. Censo Nacional de Población y Viviendas, 2012.

Datos actualizados (setiembre 2020) facilitados por la DEGEEC ante la solicitud escrita de la empresa Paracel.S.A. en el marco de elaboración del presente estudio.

⁶ Plan Local de Salud de San Alfredo, 2015/2018

⁷ Datos solicitados y proveídos por la DGEEC. Sep.2020.

⁸ Sector Económico de la población ocupada (de 12 años y más de edad que pertenece a una rama de actividad específica), donde el sector *primario* comprende a la agricultura, ganadería, caza y pesca; el *sector secundario* abarca las industrias manufactureras, construcción, minas y canteras; el *sector terciario* agrupa a electricidad, gas y agua, comercio, restaurantes y hoteles, transporte, almacenamiento y comunicaciones, finanzas, seguros, inmuebles, servicios comunales, sociales y personales; y no informado

1.4. Acceso a servicios

En este apartado se presenta contenido relacionado al acceso a servicios en el AID del Proyecto. Se logró contar con información distrital actualizada sobre servicios básicos, educación, formación profesional y técnica, salud, tecnologías de la información y medios de comunicación (TICs) y bienes de confort en cada uno de los distritos involucrados y desde la percepción de los pobladores consultados.

Acceso a Servicios básicos

Según los datos proveídos por la DGEEC, en cuanto a energía eléctrica se puede observar que el 92,3% de las viviendas acceden a este servicio; en relación con el acceso al agua corriente, el 78,7% de las viviendas cuentan con este servicio; el 33,1% se trata de viviendas con saneamiento mejorado. Como puede observarse en la siguiente tabla, es baja o nula la cantidad de viviendas que cuentan con el servicio de recolección de basura. Todos estos datos en la siguiente tabla.

Tabla 7. Viviendas con Acceso a Servicios Básicos

Datos de viviendas particulares Servicios básicos	Departamento de Concepción	Distrito de San Alfredo
Viviendas particulares ocupadas	42.402	966
% Viviendas con energía eléctrica	93,1	92,3
% Viviendas con agua corriente ⁹	74,4	78,7
% Viviendas con desagüe cloacal ¹⁰	6,3	-
% Viviendas con recolección de basura	22,8	0,7
% Viviendas con saneamiento mejorado	46,9	33,1

Fuente: STP/DGEEC. Censo Nacional de Población y Viviendas, 2012.

En cuanto a la disposición de residuos sólidos según datos del Plan Local de Salud de San Alfredo, la Municipalidad carece de un vertedero para la disposición y el tratamiento de los residuos sólidos. Los medios de eliminación frecuentemente utilizados por la población son la quema y entierro¹¹.

En relación a los servicios sanitarios, según se indica en la misma fuente, se estima que el 20% de la población del área urbana posee baño moderno, mientras que en el área rural predomina la utilización de letrinas sanitarias.

Educación

Sobre el acceso a la educación en el distrito, los datos del Plan Local de Salud y documentación oficial del Ministerio de Educación y Ciencias indican que los niños y las niñas en su mayoría acceden a los servicios de educación escolar básica, igualmente existen instituciones de educación media, no así instituciones de enseñanza superior.

⁹ Incluye: ESSAP, SENASA, red comunitaria, red privada, y pozo artesiano, con cañería fuera de la vivienda pero dentro del terreno o con cañería hasta la cocina y/o baño.

¹⁰ Incluye: Desagüe por red pública, pozo ciego con y sin cámara séptica.

¹¹ Plan Local de Salud de San Alfredo 2015/2018

Según los datos actualizados del MEC¹², en el distrito se encuentran 12 instituciones educativas, de las cuales 1 se encuentra en el área urbana y 11 en el área rural. Estas imparten enseñanza de nivel inicial, escolar básica y nivel medio como se expone a continuación.

Tabla 8. Nivel educativo por zona

Nivel de enseñanza	Zona		
	Total	Urbana	Rural
Educación inicial	6	1	5
Escolar Básica	8	1	7
Escolar Básica Abierta	1	-	1
Educación media	4	1	3
Total	19	3	16

Fuente: Elaboración en base a datos actualizados del MEC - Datos abiertos, Establecimientos escolares 2019

Es importante aclarar que existen establecimientos que tienen más de una institución y que en las instituciones podrían impartirse más de una modalidad.

De los materiales de consulta también se pudo extraer información relacionada a los servicios con que cuentan las instituciones, como ser el caso de dos escuelas que cuentan con almuerzo escolar durante el año lectivo, a través del apoyo de la Municipalidad; mientras que alumnos de otra institución reciben este mismo servicio a través de la Gobernación de Concepción.

En cuanto al acceso a energía eléctrica, la totalidad cuenta con este servicio por parte de la ANDE y figuran diferentes medios por los cuales estas instituciones cuentan con agua (SENASA, pozo artesiano, pozo común y en su mayoría río).

En términos de problemáticas vinculadas a la educación, se menciona que la población joven no culmina los estudios del nivel medio, debido a que la gran mayoría necesita realizar trabajos remunerados para contribuir al sustento familiar; así como se identifica un bajo acceso a estudios universitarios, teniendo en cuenta además que quienes pueden se trasladan al distrito de Concepción donde se cuenta con universidades, esto con el apoyo de la Municipalidad que facilita el traslado de los jóvenes al centro urbano de Concepción en un minibús. Se dan casos también en que migran a otras ciudades del país en busca de servicios educativos y fuentes de trabajo. La mayoría de la población adulta sabe leer y escribir, existiendo sin embargo personas sin alfabetización¹³.

A continuación, se presenta cada institución educativa y sus características:

Tabla 9. Instituciones Educativas Distrito de San Alfredo por zona, modalidad, acceso a agua y energía

Salud

En el Plan Local de Salud se hace referencia a que en la zona son frecuentes las enfermedades respiratorias, trastornos por hipertensión arterial, diabetes, enfermedades pulmonares, tabaquismo, parasitosis, entre otros y se cuenta con los siguientes centros asistenciales en el distrito:

- Unidad de Salud de la Familia (USF) de San Alfredo y
- Unidad de Salud de la Familia (USF) de Itakua/ Calería Ita Cua.
- Asimismo, fueron habilitados dos dispensarios médicos para la adquisición de medicamentos¹⁴.

USF San Alfredo- Fuente: Concepción al Día¹⁵

A través de las USFs, la población accede a los servicios de consultorio clínico, odontológico, provisión de leche a embarazadas y niños/as con bajo peso, control pre natal, test para recién nacidos, detección temprana de ITS, control de enfermedades infecto contagiosas en general, entre otras. En cuanto al acceso a vacunaciones, se presta asistencia solo en la USF de San Alfredo.

¹⁴ Plan Local de Salud de San Alfredo 2015/2018

¹⁵ Disponible en: <http://www.concepcionaldia.com/nuevos-distritos-sin-ambulancia/>

En el Plan se hace alusión, además, al hecho de que los pobladores ante necesidades de asistencia, acuden inicialmente a médicos naturalistas y parteras empíricas (una práctica arraigada en la zona) y si no encuentran mejoría acuden posteriormente a ser atendidos por los profesionales de salud. En la comunidad se cuenta con 6 médicos naturalistas, 3 parteras empíricas y los profesionales que conforman la USF de San Alfredo: 1 médico, 1 licenciada en Enfermería, 1 licenciada en Obstetricia, 1 Odontóloga que presta servicios en forma voluntaria, 2 auxiliares en enfermería, 3 agentes comunitarios y 1 personal de servicio (pagado por los funcionarios de la unidad); en la USF de Itakua cuentan con 1 médico, 1 licenciada en obstetricia, 1 licenciada en enfermería, 1 auxiliar técnica y 1 personal de servicio (pagado por el Consejo de Salud).

Acceso a Tecnologías de información y medios de comunicación (TIC) y bienes de confort

A través de los datos facilitados por la DGEEC, en relación al acceso de la población a las TICs puede afirmarse que en la gran mayoría de viviendas en el Distrito de San Alfredo se cuenta con radio, igualmente teléfonos celulares y televisor; no ocurre lo mismo con las antenas parabólicas, las computadoras, tv cable, internet y teléfono fijo, que como puede observarse en la siguiente tabla, obtuvieron porcentajes mucho menores a las tecnologías citadas inicialmente.

Tabla 10. Equipos domésticos y TICs

Acceso a TIC	Departamento de Concepción	Distrito de San Alfredo

2. Distrito de Sargento José Félix López

2.1. Características generales

El camino que une a la comunidad con el km 70 de la ruta 5 Bernardino Caballero tiene una longitud de 120 km. Concepción Noticias (2017)¹⁶

del departamento de Amambay, a aproximadamente 75 km; al oeste limita con el distrito de San Carlos del Apa, a unos 50 km.

El acceso al municipio se realiza por vía terrestre por la Ruta V hasta el km. 70, para luego seguir por el tramo-calle 15 hasta la Colonia Jorge Sebastián Miranda (Hugua Ñandu), del distrito de Paso Barreto, y se debe recorrer unos 70 km. más por camino enripiado hasta llegar al área urbana del distrito. Los caminos de tierra suelen permanecer en mal estado durante los días de lluvia.

Las personas entrevistadas durante el trabajo de campo resaltaron que “hay tranquilidad”, que la gente “es solidaria y se conocen entre todos en la comunidad”, que hay mucha naturaleza y bosques nativos en la zona, que no existe contaminación, se cuenta con un arroyo llamado Amambay. Asimismo, que se trata de una zona en la que hay producción agrícola para autoconsumo y que cuentan con lo necesario para el consumo local.

Las festividades tradicionales en Sargento José Félix López, mencionadas durante el relevamiento de información en campo son las fiestas patronales (junio), fiesta de aniversario de la distritación, desfile estudiantil, festivales, entre ellos el principal denominado “Paso Bravo” (edición decimocuarta) que generalmente cuenta con la participación de artistas de otras ciudades. En cuanto a actividades recreativas y de esparcimiento, fueron nombradas carrera de caballo y jineteada, ferias de comidas, campeonatos de fútbol tanto masculino como femenino, y otros deportes, actividades de la parroquia organizadas por jóvenes de la zona.

Asimismo, en las escuelas se organizan campeonatos deportivos, olimpiadas educativas, e intercambios inter-escolares. Desde la USF se realizan charlas con adultos mayores, club de embarazadas y de padres.

Según los datos del Plan de Desarrollo Sustentable, el municipio Sargento José Félix López fue conformado oficialmente el 7 de setiembre de 2011 por Ley N°4.418, separándose su territorio del distrito de Concepción. Abarca la superficie de 224.428 hectáreas, con 8.544 metros cuadrados. Se encuentra ubicado al noreste, a 200 km de la capital departamental y a 700 km al norte de la ciudad de Asunción. Al norte limita con Brasil, teniendo como frontera al Rio Apa, que se encuentra a 20 km; al este limita con el distrito de Bella Vista norte

2. Datos de Población

Para este apartado, los datos fueron obtenidos de la DGEEC, el Plan Local de Salud y el Plan de Desarrollo Sustentable Municipal; estos últimos elaborados por la Municipalidad de Sargento José Félix López.

Desfile Aniversario de Distritación- Fuente: Última Hora (2019)¹⁷

Según datos de la DGEEC, la población del Departamento de Concepción es de 254.976 habitantes, de los cuales 7.242 habitantes pertenecen al Distrito de Sargento José Félix López, es decir, el 2,84% de dicha población.

Como puede observarse en la siguiente tabla, la población está conformada por 3.784 hombres (52,25%) y 3.459 mujeres (47,76%) (Proyección 2020)¹⁸, cantidad que corresponde al 2,84% de la población del departamento de Concepción.

Tabla 12. Proyección de la población del Distrito de Sargento José Félix López por sexo. Año 2020

Sargento José Félix López	Población	Porcentajes
Hombres	3.784	52,25
Mujeres	3.459	47,76
Total (ambos sexos)	7.242	100
% Población Total del Departamento	254.976	2,84

Fuente: Elaboración propia en base a datos de la DGEEC. Dpto. Concepción. Población estimada y proyectada, según distrito, sexo y grupos de edad, 2000-2025

Igualmente, atendiendo a las cifras respecto a la evolución/crecimiento de la población, puede notarse que la diferencia en la relación cantidad hombres/mujeres se mantiene y que en los últimos 5 años no hubo una variación muy importante en términos de crecimiento poblacional en el distrito, según las proyecciones elaboradas por la DGEEC.

¹⁷ Disponible en: <https://www.ultimahora.com/puentesino-celebra-ocho-anos-distrolucion-un-desfile-n2842715.html>

¹⁸ DGEEC. Dpto. Concepción. Población estimada y proyectada, según distrito, sexo y grupos de edad, 2000-2025.

Tabla 13. Evolución de la población de Sargentó José Félix López en los últimos 5 años (2016-2020)

Evolución de la Población Distrital por sexo	2016	2017	2018	2019	2020

En la siguiente tabla puede observarse que existe una disminución de la población del Distrito de Sargentó José Félix López en relación a lo proyectado en la tabla anterior para el año 2020 (según datos suministrados por la DGEEC).

Tabla 14. Evolución de la población en los siguientes 5 años (2020-2025)

Departamento y distrito	Año					
	2020	2021	2022	2023	2024	2025
Dpto. Concepción	254.976	258.653	62.360	266.072	269.805	273.579
Sargentó José Félix López	7.087	7.144	7.202	7.258	7.314	7.369

Fuente: STP/DGEEC. Paraguay. Proyección de la población por sexo y edad, según distrito, 2000-2025. Revisión 2015

Por su parte, el documento del Plan Local de Salud indica que la población total es de aproximadamente de 10.000 habitantes según los registros de la Municipalidad, con una densidad poblacional de 22 personas por hectárea; el 30% de la población reside en la zona urbana y el 70% reside en la zona rural¹⁹.

Tabla 15. Población por zona Urbana y Rural

Sargentó José Félix López	Población	Porcentaje
Área urbana	3.000	30%
Área rural	7.000	70%
Total	10.000	100%

Fuente: Elaboración propia con datos del Plan Local de Salud 2015/2018.

El territorio distrital cuenta con 9 barrios en la **zona urbana**: Santa Ana, San Clemente, La Suerte, Piri Poty, Unión, Yvype, Porvenir, Ara Poty, Loma Pyta y 4 asentamientos en la **zona rural**, que a su vez se divide en barrios, calles, líneas, y zonas. Los Asentamientos son: Norte Pyahú (que se divide nuevamente en los siguientes barrios: Cerrito, Hermosa, Vya Renda, Kurusu Eva, Calle 1, Calle 13 y Calle 14), Yvy Maraney (dividido en San Francisco, San Antonio, 3 Lomas, San Roque, San Cayetano), 29 de Junio (se divide en Calles: Calle 2, 3, 4, 6, 7, 8, 11, 12; Sótano, 1^a Línea, 2^a Línea, 3^a Línea, Ruta San Carlos, Arroyo Mborevikua) y Calle 4 (se divide en 1^a Zona, 2^a Zona y Curupayty)²⁰.

Población Indígena

En el distrito de Sargentó José Félix López, según datos de la DGEEC, obtenidos en el III Censo Nacional de Población y Viviendas para pueblos Indígenas 2012, existe 1 comunidad indígena llamada Takuarita, perteneciente al Pueblo Mbya Guaraní, conformada por 142 habitantes, 72

¹⁹ CIRD y MSPyBS. Plan Local de Salud de Sargentó José Félix López. 2015-2018.

²⁰ CIRD y MSPyBS. Plan Local de Salud de Sargentó José Félix López. 2015-2018.

hombres y 70 mujeres, distribuidos en 30 viviendas particulares y colectivas, en el área rural²¹. De la totalidad de la población del distrito (7242), el 1,96% corresponde a la mencionada comunidad indígena, siendo en su mayoría, hombres con el 50,70% y mujeres con el 49,30%.

Tabla 16. Población indígena de Sargento José Félix López, por sexo. Año 2012

Distrito de Sargento José Félix López	Población Indígena	Porcentajes

Hogares, vivienda

Otros datos proveídos por la DGEEC en relación a la condición de propiedad de la vivienda en el distrito indican que en este existen 1.221 viviendas particulares ocupadas precensadas, resultando ampliamente mayoritaria la población que cuenta con vivienda propia, seguida de la condición de “prestada” o quienes las habitan como “encargados”²², y en menor cantidad, viviendas alquiladas, condición de ocupación de hecho o en condominio. Los porcentajes pueden observarse en la siguiente tabla.

Tabla 17. Condición de propiedad de la vivienda

2.3. Economía

Actividades económicas

En cuanto a las actividades económicas, se afirma que el distrito es eminentemente ganadero y que existen numerosos establecimientos ganaderos en dicha zona. Asimismo, sus habitantes se dedican a la explotación forestal y agrícola, esta última en menor escala debido a la falta de caminos y al bajo precio de los productos en el mercado local y regional, aspectos que limitan la producción a gran escala o para comercialización. Actualmente puede decirse que la agricultura es más que nada para autoconsumo. La población también se dedica a las actividades comerciales y a la prestación de servicios profesionales en instituciones públicas y privadas, aserraderos y las estancias²⁵.

Registro fotográfico de trabajo de campo. Equipo consultor. Concepción. Agosto -septiembre 2020.

En cuanto a la comunidad indígena de Takuarita, podría decirse que las actividades de subsistencia están basadas en la recolección, caza y pesca²⁶.

²⁵ Plan Local de Salud de Sargentó José Félix López (Puentesiño) periodo 2015-2018

Fuente: Elaboración propia con datos de la Municipalidad 2020 y el Plan Local de Salud de Sargento José Félix López. 2015/2018.

Durante el trabajo de campo las personas entrevistadas comentaron respecto a las principales actividades económicas del distrito mencionando las siguientes:

- Trabajo en estancias como mensualeros y jornaleros.
- Hay personas que se dedican a changas, realizan actividades de manera esporádica, por día o por trabajo específico.
- Producción ganadera de pequeña y gran escala.
- En cuanto a comercio, se cuenta con despensas, ferretería, talleres de vehículos (con muchos vehículos abandonados por la facilidad de compra sin documentación legal), comedores, lugares de alojamiento, también aserraderos (madera para exportar) y carpintería.
- En la producción agrícola, los rubros de renta son el maíz y sésamo (1 cosecha al año), el maíz tupi pytä se vende a una estancia de la zona para alimento de animales. Hay además producción de maní, zapallo, mandioca, batata, éstos son comercializados en la Ciudad de Puentesño principalmente.
- Actualmente hay empresas que trabajan en obras viales.
- Empleados del Estado.

Como puede observarse en la siguiente tabla con información proveída por la DGEEC²⁷, respecto a los sectores económicos, en el Distrito de Sargento José Félix López predomina el sector primario, seguido por el sector terciario y en menor proporción el secundario.

Tabla 20. Población ocupada por sector económico

Datos de Población	Departamento de Concepción	Distrito de Sargento José Félix López
Sector económico de la población ocupada ²⁸	226.585	6.610

Fuente: STP/DGEEC. Censo Nacional de Población y Viviendas, 2012.

²⁷ Datos solicitados y proveídos por la DGEEC. Sep. 2020,

²⁸ **Sector Económico de la población ocupada:** Población ocupada de 12 años y más de edad que pertenece a una rama de actividad específica, donde el *sector primario* comprende a la agricultura, ganadería, caza y pesca; el *sector secundario* abarca las industrias manufactureras, construcción, minas y canteras; el *sector terciario* agrupa a electricidad, gas y agua, comercio, restaurantes y hoteles, transporte, almacenamiento y comunicaciones, finanzas, seguros, inmuebles, servicios comunales, sociales y personales; y no informado.

2.4. Acceso a servicios

Servicios Básicos

En lo referente a acceso a servicios básicos, en el Distrito de Sargento José Félix López, según los datos proveídos por la DGEEC²⁹, se cuenta con energía eléctrica, agua corriente y saneamiento mejorado. A continuación, se presenta la información en porcentajes, y su vinculación con las cifras de nivel departamental.

ANDE Puentesiño

Fuente: Registro fotográfico de trabajo de campo. Equipo consultor. Concepción. Agosto -Septiembre 2020

Sistema de Agua Centro Puentesiño

Tabla 21. Viviendas con Acceso a Servicios Básicos

Datos de viviendas particulares	Servicios básicos	Departamento de Concepción	Distrito de Sargento José Félix López
Viviendas particulares ocupadas	42.402	1.221	
% Viviendas con energía eléctrica	93,1	73,1	
% Viviendas con agua corriente ³⁰	74,4	59,9	
% Viviendas con desagüe cloacal ³¹	6,3	-	
% Viviendas con recolección de basura	22,8	0,1	
% Viviendas con saneamiento mejorado	46,9	6,8	

Fuente: STP/DGEEC. Censo Nacional de Población y Viviendas, 2012.

En el Plan Local de Salud del distrito se menciona que se tiene acceso a servicios básicos, gran parte de la zona urbana y rural cuenta con el servicio de energía eléctrica, excepto las comunidades de: 29 de Junio, Sótano, 1^a Zona, 2^a Zona y Curupayty, que esperan la ampliación del tendido eléctrico. En las compañías, la mayoría de la población accede al servicio de agua potable, otras utilizan agua de pozo (La mayoría de los pobladores utiliza agua de pozo artesiano), arroyos y tajamares para su abastecimiento³².

²⁹ Datos solicitados y proveídos por la DEGEEC. Sep. 2020.

³⁰Incluye: ESSAP, SENASA, red comunitaria, red privada, y pozo artesiano, con cañería fuera de la vivienda pero dentro del terreno o con cañería hasta la cocina y/o baño.

³¹ Incluye: Desagüe por red pública, pozo ciego con y sin cámara séptica.

³²CIRD y MSPyBS. Plan Local de Salud Sargento José Félix López (Puentesiño) periodo 2015-2018

Las Juntas de Saneamiento se encuentran funcionando en las comunidades de La Suerte, San Clemente, Unión, Loma Pyta, Yvype Santa Ana, Yvy Maraney, Sótano, Calle 4, Calle 3, 29 de Junio y Norte Pyahú. Las personas entrevistadas en el marco del presente estudio afirmaron que se cuenta con sistemas de agua vía SENASA, también se utilizan tajamares, el arroyo, pozos comunes e incluso agua de lluvia. Se comentó además, sobre zonas donde no hay agua, como en el caso de calle 7, Norte Pyahu y calle 3, “se cavaron tres pozos con más de 100 metros y no se encontró agua”. Asimismo, hablaron de la existencia de por lo menos 10 juntas de agua y saneamiento en la zona.

Por su parte, en la comunidad Indígena de Takuarita no cuentan con el servicio de luz eléctrica, utilizan lámparas, velas y candiles como las formas más comunes de alumbrar por las noches³³.

En cuanto a la disposición de residuos sólidos, la Municipalidad ha dispuesto un lugar para el depósito de los mismos, pero todavía no se cuenta con el servicio de recolección. Los pobladores queman o entierran actualmente sus desechos domiciliarios.

Otro aspecto importante para la salud es la utilización de sanitarios. La mayoría de las viviendas dispone de letrinas sanitarias, por tanto, pocas cuentan con baño moderno.

Educación

En cuanto al tema de acceso a la educación, en el Plan Local de Salud del distrito se plantea que en la población en edad escolar se registra alta matriculación, la mayoría de los/as niños/as accede a la educación escolar básica, reciben almuerzo y merienda escolar en sus respectivas escuelas³⁴.

Según datos del Ministerio de Educación y Ciencias³⁵, en el Distrito Sargento José Félix López existen 27 instituciones educativas, de las cuales, 19 se encuentran en el área rural (1 en la Estancia Buenaventura, privada subvencionada y 1 en la Comunidad Indígena Takurita), y 8 en el área urbana, una es la sede de la Supervisión Administrativa y Pedagógica Región en la cual también se imparte enseñanza. De la totalidad de instituciones en el área rural, todas tienen modalidad de Educación Escolar Básica y en el área urbana 7 son con modalidad de Educación Escolar Básica y 3 con Modalidad de Educación Media.

Es importante aclarar que existen establecimientos que tienen más de una institución y que en las instituciones podrían impartirse más de una modalidad.

En cuanto a acceso a servicios básicos de estas instituciones, 17 de ellas cuentan con energía eléctrica a través de la ANDE y 14 acceden al servicio de agua por parte de SENASA, 4 a través de un tajamar y 2 se abastecen desde arroyos.

En relación a la educación superior, en el distrito no se cuenta con universidades, sin embargo, para algunos jóvenes se hace posible asistir a éstas, a través de la Municipalidad de Sargento José Félix López que les otorga becas de estudio.

A continuación, se presenta cada institución educativa y sus características.

Formación profesional y técnica

La municipalidad de Sargento José Félix López, según se indica en las fuentes consultadas, también pone a disposición de la población capacitaciones en oficios, tales como carpintería, albañilería, electricidad, plomería, fontanería, cocina, peluquería, entre otros, a fin de mejorar los ingresos y la calidad de vida de sus familias³⁶.

Según esta fuente, los adultos en su mayoría saben leer y escribir. Funcionan en el distrito centros de alfabetización de adultos. Algunos son beneficiados con la pensión no contributiva que ofrece el Ministerio de Hacienda³⁷.

Según publicaciones del Servicio Nacional de Promoción Profesional (SNPP), en Sgto. José Félix López, más de 100 jóvenes y adultos del distrito concluyeron su formación en Electricidad domiciliaria (60) y Ayudante Albañilería (50) en el Asentamiento Norte Pyahu, mediante una

³⁶ MEC. Disponible en: https://datos.mec.gov.py/data/establecimientos_escolares_priorizados_elegibles_fonacide

³⁷ Ídem

de sus aulas móviles, con el respaldo de la Secretaría Nacional de la Vivienda y el Hábitat (SENAVITAT).³⁸

Salud

En lo relacionado a aspectos vinculados al acceso a la salud, inicialmente se hace referencia a las enfermedades más frecuentes en la zona. En el Plan Local de Salud de Sargento José Félix López se citan a enfermedades respiratorias, gastrointestinales y dermatológicas, parasitosis, enfermedades crónicas no transmisibles (diabetes, hipertensión, tumores, arteriosclerosis) y problemas bucodentales³⁹.

Asimismo, se hace alusión a que tanto la Municipalidad como la USF apoyan a técnicos del Servicio Nacional de Erradicación del Paludismo (SENEPA) para llevar a cabo trabajos en las comunidades, consistentes en visitas casa por casa y difusión radial de informaciones, fumigación, búsqueda y eliminación de criaderos, identificación de síntomas relacionados a la vigilancia de chagas, dengue y leishmaniasis y campañas de prevención.

Igualmente, se desarrollan otras actividades a nivel comunitario: charlas educativas en escuelas y colegios, difusión de informaciones a través de programas radiales, visitas domiciliarias para vacunación y seguimiento a embarazadas, adultos mayores, personas con diabetes, entre otros grupos que requieren cuidados específicos.

Las instituciones de servicio público de salud existentes en el municipio, según los datos del plan Local de Salud⁴⁰ son las mencionadas a continuación, se cuenta, además, con 2 farmacias privadas.

- ✓ USF de Puentesiño
- ✓ Puesto Satélite Yvype
- ✓ Puesto Satélite Yvy Maraney
- ✓ Puesto Satélite 29 de Junio y
- ✓ Puesto Satélite Norte Pyahu

En la comunidad indígena de Takuarita no cuentan con instituciones de servicios de salud⁴¹.

En cuanto a los profesionales con quienes se cuenta, según el Plan Local de Salud, la USF de Puentesiño (establecimiento de cabecera del distrito) ofrece asistencia a través de: 1 médico (Director), 3 licenciadas en enfermería, 1 auxiliar, 2 personales administrativos y 1 personal de servicio (limpiadora), no cuenta con laboratorio, el centro de referencia es el Hospital Regional de Concepción⁴².

3. Distrito de Bella Vista Norte

3.1. Características generales

Río Apa Bella Vista Norte- Fuente: Bienvenido Paraguay⁴³

El Distrito de Bella Vista Norte posee una extensión de 3.901 Km, se encuentra ubicado al extremo noreste de la Región Oriental, a 469 km de Asunción y 150 km de Pedro Juan Caballero, su principal acceso es la Ruta Nacional N°3 Gral. Elizardo Aquino. Al norte y este limita con la República Federativa del Brasil, separado por el Río Apa y la Cordillera de Amambay; linda al sur con Canindeyú y al oeste con Concepción y San Pedro⁴⁴.

Según los datos del Plan de Desarrollo Municipal (2016)⁴⁵, en el año 1.851 se fundó la localidad de Villa Bella. Desde el año 1.860 la zona donde hoy se asienta comenzó a poblar y durante el gobierno de Héctor Carvallo, tomó como nombre Bella Vista Norte y fue elevada a la categoría de Municipio. Pero recién en 1.901 fue creado el municipio de Bella Vista Norte, en virtud de un decreto del presidente Emilio Aceval. Según historiadores, la misma sería la localidad más antigua del Departamento.

Además, el nombre de Bella Vista tiene su origen en un paso de ganado que existía sobre el Río Apa, que por su gran belleza natural llamaba la atención, cabe mencionar que también se le llama Bella Vista Norte, como una forma de diferenciarla de la otra Bella Vista que se encuentra ubicada en el sur del país⁴⁶.

3.2. Datos de Población

Según datos de la Dirección General de Estadística, Encuestas y Censo (DGEEC), la población total del Departamento de Amambay es de 172.169, perteneciendo al Distrito de Bella Vista 17.765 habitantes. Esta totalidad representa al 10,32% de la población del departamento. Bella Vista está

3.3. Economía

Actividades económicas

Según información de la Municipalidad de Bella Vista, la economía del distrito se basa predominantemente en producción agrícola y ganadera; se destaca además el comercio fronterizo por encontrarse frente a la ciudad brasileña del mismo nombre (Bela Vista). Es importante mencionar aquí la gran oportunidad con la que cuentan de explotar turísticamente la zona gracias a sus atractivos naturales.

Asimismo, en Bella Vista se encuentran asentados pobladores pertenecientes a Pueblos Originarios, cuyas actividades económicas se centran en la caza, pesca, recolección de alimentos y también en menor medida la venta de artesanías⁵¹.

3.4. Acceso a servicios

Acceso a servicios básicos

Según datos extraídos del Plan de Desarrollo Municipal los pobladores del distrito de Bella Vista acceden a servicios básicos como; sistema de eliminación de basura; desechos cloacales (pozos ciegos absorbentes), el acceso a agua corriente en zona rural lo hacen por medio de juntas de saneamiento y en la zona urbana a través de la ESSAP.

⁵⁰ DGEEC. Necesidades Básicas Insatisfechas (NBI) 2012 PARAGUAY. Disponible en: <https://www.dgeec.gov.py/Publicaciones/Biblioteca/investigacion%20tematica/Triptico-de-necesidades-insatisfechas-NBI-2012.pdf>

⁵¹ Municipalidad de Bella Vista. (2016) Plan de Desarrollo Municipal. Período 2016-2021.

En esta línea, según indicadores distritales del censo 2012 de la DEGEEC, en el distrito de Bella Vista, el 78,62 % de la población tiene acceso a luz eléctrica; el 61,76% de la población tiene acceso a agua corriente; el 20,34% accede a la disposición de residuos sólidos.

Según el Plan de Desarrollo Municipal, los servicios sociales disponibles en Bella Vista Norte son:

- Asistencia a la primera infancia a través de la guardería de ALMA GUARANI, reforma, ampliación, equipamiento, funcionamiento y mantención de la misma mediante las gestiones paralelas de la municipalidad y los padres de los beneficiarios de dicho servicio.
- Servicio de asistencia a personas de escasos recursos mediante la provisión de medicamentos, estudios médicos, y traslado de enfermo.
- Apoyo constante a instituciones educativas.
- Apoyo Universitario con beca y gestiones para usufructo de beca universitario con ITAIPU, Secretaría Nacional de la Juventud y Consejo Nacional de Becas.
- Campaña de recolección y distribución de abrigos en épocas de frío.
- Acompañamiento y ayuda a las familias afectadas por las inundaciones.
- Apoyo económico a las Instituciones Educativas más necesitadas.
- Transporte escolar para los alumnos de las Escuelas de Santa Ana y San Isidro.
- Apoyo mediante el programa de gobierno de la Secretaría de la Acción Social. específicamente con Tekoporã.

Educación

En relación al acceso a la educación, según datos del Ministerio de Educación y Ciencias (MEC), en el Distrito de Bella Vista se encuentran 30 instituciones educativas, de las cuales 8 están ubicadas en el área urbana y 22 en el área rural. De la totalidad, de instituciones, 13 tienen Modalidad de Educación Inicial (4 en el área urbana y 9 en el área rural); 27 instituciones con Modalidad de Educación Escolar Básica (5 en el área urbana y 22 en el área rural); 3 instituciones con Modalidad de Educación Media (2 en el área urbana y 1 en el área rural); 2 instituciones con Modalidad de Educación Permanente, ambas en el área urbana. Los datos se señalan en la siguiente tabla.

Tabla 32. Nivel educativo según zona de ubicación

4. Distrito de Paso Barreto

4.1. Características generales

El 31 de mayo del año 2013 la Ciudad de Paso Barreto fue distritada por Ley Nº 4.926, ubicada a 56 km de distancia de la capital de Concepción, unido por un camino de tierra enripiada. El distrito tiene una extensión de 215.824 hectáreas⁵³. La distancia de Paso Barreto a la capital del País es de 445 km por Ruta Horqueta.

Limita al Norte con Sargento José Félix López, al Este con Yby Yau, al Sur con Horqueta y Loreto, al Sur Oeste con Concepción y al Oeste con San Alfredo.

Desde lo señalado por referentes del municipio⁵⁴, se desconoce la fecha exacta de la fundación de la Ciudad de Paso Barreto, aunque aseguran tiene origen fundacional muy antiguo, mediados de 1.800 (aproximadamente) según los primeros pobladores. Se sabe que el nombre guarda relación con un hombre de apellido Barreto que radicaba en la zona desempeñándose como pasero en balsa por el Río Aquidabán, éste era reconocido por su carácter amable y hospitalario.

Así mismo, en el Plan Local de Salud de Paso Barreto se señala que la población era muy reducida en aquel entonces, aproximadamente 15 viviendas. Las primeras familias que poblaron fueron de apellidos De León, Ferreira y Blanco. En el año 1870, el 9 o 10 de febrero, pasó por el lugar el ejército para captura y muerte del Mariscal Francisco Solano López en Cerro Cora, y el 3 o 4 de marzo del mismo año estuvo como prisionera de guerra Alicia Elisa Lynch, la esposa del Mariscal López.

En la consulta realizada en campo, los pobladores del distrito (Localidad de Paso Barreto, Isla Hermosa, Estribo del Plata y Jorge Sebastián Miranda), han manifestado que se destacan “la buena convivencia”, que son “comunidades muy tranquilas”, que hay “unidad entre los pobladores”, con “personas con ganas de trabajar y sobresalir”, con “muchas naturalezas y bajo nivel de contaminación”.

También, han comentado que las actividades festivas importantes para la zona están relacionadas al ámbito religioso y fundacional (distritación), durante los meses de junio, agosto, septiembre y diciembre.

Asimismo, se realizan actividades como karu guazú (comida compartida/comunitaria), bingos y torneos de inter-barrio; actividades deportivas, laceadas, pesca y visitas al Río Aquidabán; igualmente, actividades por el día del niño y de la juventud, con campeonatos intercolejiales, festivales, entre otros.

⁵⁴ Municipalidad de Paso Barreto. Disponible en: <https://www.municipalidadpasobarreto.gov.py/>

En las Actividades de las USF destacan caminatas con adultos mayores, diabéticos e hipertensos donde también acompañan los niños, charlas y juegos, actividades con el club de madres y embarazadas, entre otras.

4.2. Datos de Población

Según datos de la Dirección General de Estadística, Encuestas y Censo (DGEEC)⁵⁵, la proyección de la población del Departamento de Concepción es de 254.976, perteneciendo al Distrito de Paso Barreto 4.185 habitantes. Esta totalidad representa 1,64% de la población del departamento. Paso Barreto está conformado por 1.944 hombres y 2.241 mujeres (Proyección 2020). Como se puede observar en la siguiente tabla en su mayoría, es decir, el 53,55% de la población del distrito está conformada por mujeres y el 46,45% por hombres.

Tabla 34. Población estimada y proyectada de Paso Barreto, por sexo. Año 2020

Paso Barreto	Población	Porcentajes
Hombres	1.944	46,45
Mujeres	2.241	53,55
Total (ambos sexos)	4.185	100
% Población Total del Departamento	254.976	1,64

Fuente: *Elaboración propia en base a datos de la DGEEC. Dpto. Concepción. Población estimada y proyectada, según distrito, sexo y grupos de edad, 2000-2025*

Con respecto a los datos de proyección de la DGEEC⁵⁶ para el Distrito de Paso Barreto, se puede observar en la siguiente tabla, que la población total en los últimos 5 años ha aumentado lentamente, considerando que la cantidad de hombres disminuye y la de mujeres aumenta.

Tabla 35. Evolución de la población en los últimos 5 años (2016-2020)

Distrito Paso Barreto	2016	2017	2018	2019	2020
Hombres	1.990	1.979	1.967	1.956	1.944
Mujeres	2.146	2.169	2.193	2.217	2.241

Actividades económicas

En el Distrito de Paso Barreto predominan las actividades relacionadas al sector primario con el 57,6%, seguido del sector terciario con 23,9% y finalmente con menor porcentaje, el sector secundario con el 17,0%. En la siguiente tabla se señalan los datos por sector económico de la población, tanto a nivel distrital como departamental.

Tabla 41. Población ocupada por sector económico

Datos de Población	Departamento de Concepción	Distrito de Paso Barreto
Sector económico de la población ocupada	226.585	4.085
% Primario	40,9	57,6
% Secundario	15,7	17,0
% Terciario	42,2	23,9
% No informado	1,2	1,5

Fuente: STP/DGEEC. Censo Nacional de Población y Viviendas, 2012.

Con respecto a las actividades económicas, los pobladores de las localidades de Paso Barreto, Isla Hermosa, Estribo del Plata y J.S. Miranda, han mencionado que las principales son la agricultura y pequeña ganadería con producción de leche y derivados, en su mayoría para auto consumo y la ganadería a gran escala por las estancias de la zona. Faena de vaca, gallina y ganado menor. Producción y venta de sombreros de karanday. También, pesca con fines comerciales y consumo, aserraderos, carbonerías y frigoríficos.

Asimismo, mencionaron que los pobladores migran por trabajo, los hombres desde temprana edad (a partir de los 12 años, algunos ya no continúan sus estudios), van al Chaco para trabajar en las estancias como jornaleros mediante contratistas; las mujeres, algunas trabajan en las estancias con sus esposos y otras migran a Pedro Juan Caballero, Asunción, Argentina y España.

Otro aspecto señalado radica en que las mujeres, en su mayoría se dedican a tareas del hogar, otras mujeres al comercio, decoración, alquileres, gastronomía en general, peluquería, corte y confección (se cuenta con capacitaciones del SNPP), y en algunos casos, funcionarias del Estado, así como algunos pobladores son funcionarios públicos y otros comerciantes.

4.4. Acceso a servicios

Acceso a Servicios básicos

En relación al acceso a servicios básicos en el distrito de Paso Barreto, se tienen datos proveídos por la DGEEC⁶². En la siguiente tabla se observa que en cuanto a energía eléctrica el 85,2% de las viviendas cuentan con este servicio; el 70,3% de las viviendas tienen acceso a agua corriente; el 22,1% de viviendas con saneamientos mejorados; en menor proporción el 0,1% de las viviendas cuentan con servicio de recolección de basura.

Tabla 42. Viviendas con acceso a servicios básicos

Datos de viviendas particulares Servicios básicos	Departamento de Concepción	Distrito de Paso Barreto
Viviendas particulares ocupadas con personas presentes	42.402	838
% Viviendas con energía eléctrica	93,1	85,2
% Viviendas con agua corriente ⁶³	74,4	70,3
% Viviendas con desagüe cloacal ⁶⁴	6,3	-
% Viviendas con recolección de basura	22,8	0,1
% Viviendas con saneamiento mejorado	46,9	22,1

Fuente: STP/DGEEC. Censo Nacional de Población y Viviendas, 2012.

Así mismo, según los datos del Plan Local de Salud⁶⁵ en el mismo distrito, se observa que en la zona urbana cuentan con servicio de agua corriente y energía eléctrica. Sin embargo, las comunidades indígenas no acceden a estos servicios, se proveen de agua de arroyos, tajamares, aljibes y pozos.

En cuanto al manejo de residuos sólidos, los datos del Plan Local de Salud de Paso Barreto muestran que la Municipalidad no posee vertedero para la disposición y el tratamiento de estos y la práctica más usual es la quema⁶⁶. En relación al saneamiento básico, la mayoría de la población utiliza letrinas comunes, en menor proporción existen hogares que cuentan con baños modernos⁶⁷.

Pobladores de las localidades que han participado en la consulta para el presente estudio, de Paso Barreto, Isla Hermosa y J.S. Miranda, han mencionado que cuentan con red de agua potable a través de las juntas de saneamiento, algunos por vía de la gobernación, pero el mantenimiento es a través de las comisiones, a excepción de Estribo de Plata que no cuenta con comisión de agua y en su mayoría utilizan pozos.

Las comunidades indígenas de la zona cuentan con tanques, una tiene sistema de agua, otra no porque no tienen energía eléctrica, pero sacan del Río Aquidaban, pozo o de arroyos cercanos.

⁶² Datos solicitados y proveídos por la DEGEEC. Sep. 2020.

⁶³ Incluye: ESSAP, SENASA, red comunitaria, red privada, y pozo artesiano, con cañería fuera de la vivienda pero dentro del terreno o con cañería hasta la cocina y/o baño.

⁶⁴ Incluye: Desagüe por red pública, pozo ciego con y sin cámara séptica.

⁶⁵ MSPBS-CIRD. (2015) Plan Local de Salud de Paso Barreto. Período 2015-2018. Disponible en: https://www.cird.org.py/institucional/documentos/Plan_Local_Salud_Paso_Barreto.pdf

⁶⁶ Ídem

⁶⁷ Ídem

En relación al acceso a desagüe pluvial, la única localidad que cuenta con este servicio es Paso Barreto y actualmente se encuentran trabajando en un proyecto de alcantarillado sanitario en la ciudad.

Con respecto al uso de Pozo séptico/Letrina/Otro, han mencionado que en Paso Barreto el 40% tiene letrina, debido la vulnerabilidad y escasos recursos, en la zona urbana se utiliza pozo ciego y cámara séptica. En Isla Hermosa sólo el 2% cuenta con baño moderno, la mayoría dispone de letrina. En Estribo de Plata sólo en 5 viviendas se cuenta con pozo ciego, en su mayoría letrina y en J. S. Miranda la mayoría tiene baño común, menos del 45% tiene baño moderno (beneficiarios del proyecto de vivienda).

También, han mencionado que en el Distrito no cuentan con planta de tratamiento de basura ni con servicio de recolección, aún acuden a la quema o entierro; en la Ciudad de Paso Barreto se quema semanalmente en un sitio específico (en la Municipalidad).

Así mismo, en las localidades consultadas se confirmó que existen viviendas que no cuentan con conexión de ANDE, como el caso de J.S. Miranda y Estribo de Plata. También mencionaron que tienen cortes muy seguido y que las instalaciones son muy precarias.

Formación Profesional y Técnica

En lo que refiere al acceso a la formación profesional y técnica, dentro del Departamento de Concepción se observan varias ofertas de enseñanza en instituciones públicas y privadas. Según los datos extraídos de la página oficial de SINAFOCAL, en el distrito de Paso Barreto está planificado impartir cursos de Operación Básica de Computadoras.

Salud

En el Plan Local de Salud de Paso Barreto⁷⁰ se señala que las enfermedades más frecuentes en los adultos son la hipertensión y la diabetes; en los niños y las niñas se observan enfermedades como anemia, parasitosis, afecciones respiratorias y enfermedades bucodentales.

Las actividades del profesional de la salud consisten en realizar visitas domiciliarias, seguimiento a pacientes con enfermedades crónicas, detección temprana de embarazos en la comunidad, desarrollo de charlas educativas, vacunación y prestación de servicios en consultorios móviles. En Paso Barreto se cuenta con:

- 1 Unidad de Salud de la Familia en Paso Barreto
- 1 Unidad de Salud de la Familia en Jorge Sebastián Miranda
- 1 Puesto de Salud Isla Tuyu
- 1 Farmacia privada
- En la Municipalidad funciona un dispensario de medicamentos gratuito
- 2 Parteras empíricas: realizan partos en la comunidad
- 6 Médicos Naturalistas: realizan atenciones y recetan remedios caseros en base a hierbas.

USF Paso Barreto -Fuente: Registro fotográfico de trabajo de campo. Equipo consultor. Concepción. Agosto -Septiembre 2020

En cuanto a la disponibilidad de profesionales de la salud y otros, se cuenta con:

- 2 Médicos
- 2 Obstetras
- 3 Licenciadas en Enfermería
- 6 Auxiliares en Enfermería
- 1 Odontóloga
- 1 Chofer de Ambulancia
- 3 Personal de limpieza.

Acceso a Tecnologías de información y medios de comunicación (TIC) y bienes de confort

Según los datos proveídos por la DGEEC, en relación al acceso a TICs, puede identificarse que en la gran mayoría de las viviendas del Distrito de Paso Barreto cuentan con radio, teléfono celular y televisor; en menor porcentaje cuentan con antena parabólica, TV cable, computadoras, entre otros. Los datos se detallan en porcentajes en la siguiente tabla.

Tabla 45. Equipos domésticos y TIC

Acceso a TIC	Departamento de Concepción	Distrito de Paso Barreto
Viviendas particulares ocupadas con personas presentes	42.402	838
% Viviendas con radio	80,6	79,5
% Viviendas con televisor	79,8	70,8
% Viviendas con teléfono fijo	8,0	0,5
% Viviendas con teléfono celular	83,3	77,7
% Viviendas con computadora	11,9	2,0
% Viviendas con computadora conectada a internet	9,2	1,2
% Viviendas con antena parabólica	10,8	19,3
% Viviendas con TV cable	13,4	2,0

Fuente: STP/DGEEC. Censo Nacional de Población y Viviendas, 2012.

Los datos mencionados coinciden con la información brindada por los habitantes de las localidades consultadas (Paso Barreto, Isla Hermosa, Estribo de Plata y J. S. Miranda), quienes han indicado que los medios de comunicación más utilizados son: Radio, Televisión, Celulares y Redes Sociales.

Asimismo, se nombraron las siguientes emisoras radiales: Radio Regional AM de Concepción, la 89.9 de Horqueta, Radio Aquidabán y Santa Cecilia, Lira FM, Cristal FM 96.5 de Arroyito, Radio Loreto; canales de televisión: Canal 9 SNT, Telefuturo y canales por cable y Celulares con internet: a través de mensajería, llamadas y grupos de whatsapp (en algunas comunidades existe mala conexión a internet), y con la pandemia ha aumentado el uso para las tareas escolares.

Con relación a los bienes de confort en las viviendas, según datos entregados por la DGEEC, señalan que un alto porcentaje de las viviendas cuentan con motocicleta, heladeras y lavarropas, y en menor porcentaje con video/DVD, ducha eléctrica, aire acondicionado, horno microondas, automóvil/camioneta y termo-calefón.

Tabla 46. Equipos domésticos y Bienes de confort

Bienes de confort	Departamento de Concepción	Distrito de Paso Barreto

5. Distrito de Loreto

5.1 Características generales

La Ciudad de Loreto se encuentra sobre una alta colina en el Departamento de Concepción, a una distancia de 20 km de la Ciudad Capital y a 440 km de Asunción. Limita con los distritos de Horqueta, Belén y Concepción. Se puede acceder a la ciudad por las rutas III Elizardo Aquino, V Bernardino Caballero y Coronel Franco-Chaco. Tiene una superficie de 996 km², organizada en 31 compañías rurales y 4 barrios urbanos⁷¹. Desde el año 1964 al año 1981 se crearon 11 colonias, correspondientes a 1969 lotes y 46.323 hectáreas⁷². El 80% vive en la zona rural.

Ciudad de Loreto. Fuente: Registro fotográfico de trabajo de campo. Equipo consultor. Concepción. Agosto -septiembre 2020

Según datos del Municipio, Loreto, conocida primeramente como “Paraje Jui’y, después “Capilla Zarza”, para posteriormente llamarse Loreto, en honor a “Nuestra Señora de Loreto”, fue fundada por Jesuitas, los cuales llegaron en 1686, pero tiene fecha de fundación el 10 de diciembre de 1792⁷³.

Desde lo expresado por los habitantes del distrito, de la ciudad de Loreto y localidades, se trata de un lugar con aspectos muy valorados por los mismos; “la tranquilidad, la armonía y la seguridad”, “conocerse entre pobladores”, “solidaridad” y “buena tierra para agricultura y ganadería”.

Asimismo, se comentó respecto de espacios de esparcimiento al aire libre y fiestas tradicionales en el distrito; fiestas patronales⁷⁴, la mayoría relacionadas al ámbito religioso, festivales, juegos tradicionales, laceada mecánica, torneos deportivos, carreras de caballo, bingo, jineteadas, entre otras. En la localidad de Jhugua Po’i, desde la USF se organizan actividades como charlas educativas con el club de embarazadas y el club de adultos mayores y en todas las escuelas se realizan festejos por el día del niño. En la localidad de Virgen del Camino mencionaron a la Asociación Cooperadora

⁷³ Datos de la Municipalidad de Loreto. Disponible en: <http://www.municipalidadloredo.gov.py/>

⁷⁴ En la ciudad de Loreto celebran esta fiesta en el mes de diciembre y en las demás comunidades consultadas en los meses de junio, octubre y noviembre.

Escolar (ACE) que organiza actividades para recaudar fondos ante necesidades de la institución y de la comunidad.

5.2. Datos de Población

Según datos de la DGEEC⁷⁵, la población total del departamento de Concepción es de 254.976 habitantes, de los cuales pertenecen al distrito de Loreto 18.879, es decir, el 7,40% del total departamental.

El distrito de Loreto está conformado por 10.034 hombres y 8.846 mujeres (Proyección 2020)⁷⁵ como puede observarse en la siguiente tabla.

Tabla 47. Proyección de la población total por sexo, según distrito. Año 2020

Distrito de Loreto	Población	Porcentajes
Hombres	10.034	53,15
Mujeres	8.846	46,86
Total (ambos sexos)	18.879	100
% Población total del distrito por total departamental	254.976	7,40

Fuente: Elaboración propia en base a datos de la DGEEC. Dpto. Concepción. Población estimada y proyectada, según distrito, sexo y grupos de edad, 2000-2025

Igualmente se presentan a continuación las cifras proyectadas de evolución de la población del distrito de Loreto en los últimos 5 años, donde se observa que la diferencia en términos de cantidad de hombres y mujeres se ha sostenido en dicho periodo, es decir que hasta el 2020 hay mayor cantidad de hombres en el distrito.

Tabla 48. Evolución de la población de Loreto en los últimos 5 años (2016-2020)

Distrito de Loreto Población por sexo	Año				
	2016	2017	2018	2019	2020
Hombres	9.782	9.847	9.911	9.973	10.034
Mujeres	8.732	8.761	8.790	8.818	8.846

Hogares, vivienda

En cuanto a la condición de propiedad de la vivienda, en la zona de influencia directa del proyecto, datos otorgados por la DGEEC⁷⁶ indican que en el Distrito de Loreto existe un total de 3.063 viviendas particulares ocupadas, de esta cantidad, el mayor porcentaje de condición de propiedad pertenece a “viviendas propias”, seguidamente la condición de propiedad “prestada o cuidan”, “alquilada” y por último en menor porcentaje, “pagando en cuotas”, “en condominio” y “ocupada de hecho”. Los datos se detallan en la siguiente tabla.

Tabla 50. Condición de propiedad de la vivienda

Condición de propiedad de la vivienda	Departamento de Concepción	Distrito de Loreto
Viviendas particulares ocupadas con personas presentes	42.402	3.063

% Es ocupada de hecho	0,8	0,5
% No informado	0,1	-

Fuente: STP/DGEEC. Censo Nacional de Población y Viviendas, 2012.

Según el plan local de Salud de Loreto 2014/2016, el área urbana está integrada por los siguientes Barrios: San Francisco, Santo Domingo, Barrio Centro, Nazareth, San Antonio, Fátima, Conavi. Y el área rural integrado por las siguientes compañías: Costa Florida, Loma Florida, San José mí, Zanja Cue San Miguel, Zanja Cue Virgen de Fátima, Zanja Cue Virgen del Rosario, Ycua Pora, Cañada Lourdes, Cañada La Paz, Villa Don Bosco, Costa Pucu, Costa Ferreira, Torales San Marcos, Torales San Roque, Torales Santo Tomas, Zanja Cue Agaigo, Santísima Trinidad, Virgen del Camino, Jhugua Rivas La Asunción, Jhugua Poi, Jhugua Guazú, Isleria, Laguna Cristo Rey, Anderi, Jhugua Rivas San Pablo, Jhugua Bonete, San Isidro, Boquerón, Virgen del Carmen.

Necesidades Básicas Insatisfechas (NBI)

Con respecto a las NBI, se señala que en el 59,5% de los hogares de Loreto se tiene al menos una NBI, el 33,1% de hogares con NBI en infraestructura sanitaria, seguidamente el 21,3% de los hogares con NBI en calidad de vivienda, el 20,7% corresponde a hogares con NBI en capacidad de

⁷⁶ Datos solicitados y proveídos por la DGEEC. Sep. 2020.

subsistencia y por último el 15,8% a los hogares con NBI en acceso a la educación. Los datos se detallan en la siguiente tabla.

Tabla 51. Hogares con NBI, según departamento y distrito

Indicadores de Necesidades Básicas Insatisfechas (NBI) (%)	Total País	Departamento de Concepción	Distrito de Loreto
Hogares particulares ocupados con personas presentes	1.232.496	42.638	3.063

5.3. Economía

Según datos proveídos por el Plan de Desarrollo Municipal y el Plan Local de Salud, la economía del Distrito de Loreto se sustenta básicamente de la agricultura y la ganadería. Los pobladores del distrito se dedican a proveer los principales productos para el consumo local; sésamo, sandía, melón, mandioca, entre otros, así como también, cría de aves, porcina, caprina y bovina. Por otro lado, en menor proporción, realizan actividades vinculadas al sector de servicio y comercio, considerando que en el distrito se encuentran instituciones públicas y aserraderos que constituyen fuentes de empleo. Se indica, además, que aún se carece de servicios públicos fundamentales y que la población registra una alta tasa de pobreza, siendo el 70% de la población pobre⁷⁷.

Actividades económicas

En cuanto a las actividades económicas del Distrito de Loreto, la información otorgada por la DGEEC indica la prevalencia de las actividades productivas relacionadas al sector primario, seguidamente las actividades del sector terciario y finalmente, el sector secundario. Los datos se detallan en porcentaje en la siguiente tabla.

Tabla 52. Población ocupada por sector económico

Datos de Población	Departamento de Concepción	Distrito de Loreto
Sector económico de la población ocupada	226.585	16.817
% Primario	40,9	66,1
% Secundario	15,7	8,0
% Terciario	42,2	25,1
% No informado	1,2	0,8

⁷⁷ Plan de Desarrollo Municipal Loreto. 2016. Disponible en: <http://www.municipalidadloredo.gov.py/wp-content/uploads/2014/11/plan-de-desarrollo-distrital-loredo2016.pdf>

En las comunidades consultadas se mencionó que las actividades productivas se encuentran muy vinculadas aún a la agricultura que progresivamente se va convirtiendo en producción solo para autoconsumo. Según comentaron en la localidad de Virgen del Camino no se comercializa a buen precio, razón por la cual el sésamo por ejemplo ya no es rubro rentable.

Se comentó, además, que una actividad importante en la zona es el trabajo realizado en estancias del Chaco, por día o por trabajo (llamado también “por trato”), también en estancias de la zona y de acuerdo con la temporada, se hace limpiezas de campos; asimismo, personas que trabajan en la capital departamental (frigorífico Concepción). En el caso de las mujeres, se mencionó que las mismas al finalizar el colegio migran a Concepción a buscar trabajo, otras se hacen cargo del hogar, trabajan como docentes o trabajadoras domésticas y que numerosos pobladores migraron a países extranjeros (España, Argentina).

La pequeña ganadería también fue mencionada, afirmando que es para consumo y venta, igualmente la producción y venta de lácteos y derivados además de cría de aves. En Jhugua Po'i se mencionó que el 50% de la población masculina de la comunidad trabaja en estancias de la zona (como peones) y en Jhugua Guazú ocurre lo mismo sólo que resaltaron el hecho de que es población joven la que trabaja de este modo. En Islería se mencionó como actividad importante la pesca en los riachos cercanos.

En la localidad de Anderí, un rubro característico de la comunidad es la elaboración y venta de sombreros de karanda'y, toda la familia se dedica se dedica al mismo rubro y la venta es concretada con compradores (patrón) que revenden en Pedro Juan Caballero y Brasil. Como actividad de changa hay motosierristas. En general se mencionó que se cuenta con pequeños comercios y despensas.

5.4. Acceso a servicios

Acceso a servicios básicos

En el Distrito de Loreto, según los datos proveídos por la DGEEC⁷⁸, en cuanto a energía eléctrica se puede observar que el 91,3% de las viviendas cuenta con este servicio; el 72,2% de las viviendas cuenta con agua corriente; solo el 25,8% de viviendas con saneamiento mejorado; el 9,2% cuenta con servicio de recolección de basura, como pueden verse en la tabla siguiente.

⁷⁸ Datos solicitados y proveídos por la DEGEEC. Sep. 2020.

Tabla 53. Viviendas con Acceso a Servicios Básicos

Datos de viviendas particulares Servicios básicos	Departamento de Concepción	Distrito de Loreto
Viviendas particulares ocupadas	42.402	3.063
% Viviendas con energía eléctrica	93,1	91,3
% Viviendas con agua corriente ⁷⁹	74,4	72,2
% Viviendas con desagüe cloacal ⁸⁰	6,3	-
% Viviendas con recolección de basura	22,8	9,2
% Viviendas con saneamiento mejorado	46,9	25,8

Fuente: STP/DGEEC. Censo Nacional de Población y Viviendas, 2012.

Otros datos extraídos del Plan Local de Salud guardan relación con información respecto al acceso a servicios de agua corriente, se señala que los habitantes del área urbana y rural del distrito de Loreto acceden a este servicio a través de Juntas de Saneamiento.

Sistema de Agua Tercera Zona - Hugua Guazú

Fuente: Registro fotográfico de trabajo de campo. Equipo consultor. Concepción. Agosto -septiembre 2020.

Con relación al servicio sanitario, se indica que predomina la letrina común en las viviendas del área rural, así como también en algunas zonas del área urbana. Se estima que un bajo porcentaje de viviendas cuentan con baño moderno, sin embargo, no se dispone del desagüe cloacal⁸¹.

En cuanto a eliminación de residuos, algunas viviendas de la zona urbana tienen acceso al servicio de recolección que es proveído por la Municipalidad, mientras que en las zonas rurales la práctica predominante para eliminar los residuos sólidos es la quema.

La mayor parte de la información presentada fue coincidente con lo mencionado por pobladores involucrados al trabajo de campo en el marco de elaboración del presente estudio, de lo cual se mencionan los siguientes aspectos:

- En las localidades vinculadas al trabajo de relevamiento de información se confirmó que se cuenta con conexión de ANDE en su totalidad, no así con servicio de recolección de basura.

⁷⁹ Incluye: ESSAP, SENASA, red comunitaria, red privada, y pozo artesiano, con cañería fuera de la vivienda pero dentro del terreno o con cañería hasta la cocina y/o baño.

⁸⁰ Incluye: Desagüe por red pública, pozo ciego con y sin cámara séptica. Ver qué decía en el borrador, es importante por q menciona desagüe

⁸¹ MSPBS-CIRD. Plan Local de Salud de Loreto. Período 2014-2016. Disponible en: https://www.cird.org.py/institucional/documentos/Plan_Local_Salud_Loreto.pdf

Los residuos se queman o se tiran en hoyos. En la localidad de Jhugua Guazú, en algunas viviendas clasifican las basuras, ya que tienen chacras y las utilizan para abono.

- En las 7 localidades involucradas se cuenta con internet y teléfonos celulares. En el caso de la comunidad Anderí comentaron que la conexión tiene muchas falencias.
- Ninguna localidad visitada cuenta con desagüe cloacal.
- En la totalidad de las localidades todavía se utiliza letrinas (Anderí, Jhugua Guazú, y Santísima Trinidad), sin embargo, en varias de ellas mencionaron contar ya con baños modernos o semi-modernos, incluyendo la utilización de pozo ciego. Tal es el caso de Laguna Cristo Rey donde el 70% de familias ya utiliza baño moderno/pozo ciego.
- En las localidades mencionaron abastecerse de agua mediante pozos para auto consumo en algunos casos y para uso doméstico (también para consumo animal) en general, en el caso de la localidad Virgen del Camino, 18 familias aproximadamente dependen de 1 pozo. Solo en una localidad se mencionó no contar con comisión o junta de agua y se afirmó no contar con asistencia de SENASA (Islería).

Educación

Con base a los datos extraídos del Plan Local de Salud y de documentación del Ministerio de Educación y Ciencias, en relación al acceso a la educación en el distrito de Loreto, se identifica que la mayoría de los niños, niñas y adolescentes acceden a la educación escolar básica y a la educación media en las instituciones públicas ubicadas en el mismo distrito.

Según datos obtenidos del Ministerio de Educación y Ciencias (MEC)⁸², en el Distrito de Loreto se encuentran 38 establecimientos educativos, de la totalidad, 25 tienen modalidad de Educación Inicial (4 en área urbana y 21 en rural), 33 establecimientos cuentan con modalidad de Educación Escolar Básica (5 en área urbana y 28 en rural), 11 establecimientos con modalidad de Educación Media (2 en área urbana y 9 en el rural) y un establecimiento con modalidad de Educación Media Abierta en el área rural.

Tabla 54. Nivel educativo por zona

Nivel educativo	Zona		
	Total	Urbana	Rural
Educación inicial	25	4	21
Escolar Básica	33	5	28
Educación media	11	2	9
Educación media abierta	1	-	1
Total	70	11	59

Fuente: elaboración en base a los datos del MEC- Datos abiertos, Establecimientos escolares 2019 y la Guía Completa de Educación en Paraguay.

Es importante aclarar que existen establecimientos que tienen más de una institución y que en las instituciones podría impartirse más de una modalidad.

En lo que refiere a la educación superior, en el Departamento de Concepción existen diversas instituciones que ofrecen formación profesional, pública y privada, con una gran concentración en

⁸² https://datos.mec.gov.py/data/establecimientos_escolares_priorizados_elegibles_fonacide

la capital departamental. La mayoría de las universidades ofrece carreras en humanidades, notándose un déficit en la oferta de carreras de las ciencias exactas.

Por otra parte, cabe señalar que el distrito de Loreto cuenta con un Centro de Alfabetización para jóvenes y adultos que no culminaron la educación primaria. Así también están habilitadas escuelas de danza, guitarra, entre otros.

Fuente: Registro fotográfico de trabajo de campo. Equipo consultor. Concepción. Agosto -septiembre 2020.

En cuanto al acceso a servicios básicos como energía eléctrica en los establecimientos educativos, 29 de la totalidad cuentan con este servicio por parte de la ANDE. Existen diferentes medios por los cuales estas instituciones acceden al agua, en su mayoría a través de SENASA, en menor proporción por medio de pozo artesiano, junta de saneamiento, red comunitaria.

Entre las problemáticas en el acceso a la educación se indican, alta deserción en la modalidad escolar básica y media, atendiendo la necesidad económica de los jóvenes de este distrito y la falta de empleo local que genera la migración de los jóvenes a la capital de Concepción u otras ciudades como Asunción. Por otro lado, si bien existen universidades públicas y privadas se cuestiona la calidad educativa de las mismas. Ante esta situación se cuenta con el registro de las carreras acreditadas en el Departamento de Concepción, por la Agencia Nacional de Evaluación y Acreditación de la Educación Superior (ANEAES).

A continuación, se presenta cada institución educativa y sus características:

Tabla 55. Instituciones educativas por zona, modalidad y acceso a servicios básicos.

Salud

Según datos publicados por el Ministerio de Salud Pública y Bienestar Social, el distrito de Loreto cuenta con 5 centros asistenciales de salud pública, distribuidos en la zona, los cuales se mencionan a continuación.

- Centro de Salud Loreto
- USF Hugua Guazu
- USF Jhugua Poi
- USF Zanja Cue

- USF Cañada la Paz

USF-Jhugua Guasu

Dispensario de Salud- Hugua Po'i

USF- Hugua Po'i

El Plan Local de Salud indica que el distrito cuenta además con otros tipos de servicios orientados a la atención en la salud de sus habitantes, como:

- 1 Centro de Salud
- 2 Puestos de Salud: Sanja Cue y Jhugua Guazu
- 1 USF en Jhugua Poi
- 1 Dispensario médico en Hugua Rivas
- 1 Farmacia Social administrado por el Consejo Local de Salud
- 6 Farmacias privadas
- 15 Parteras empíricas

Además, el Plan Local de Salud indica que el Centro de Salud cuenta con 38 funcionarios, 34 corresponden a personal de blanco y 4 administrativos, de los cuales 14 son contratados por el Consejo Local de Salud (41%). Tipo de personal de salud: 3 médicos, 8 licenciadas en enfermería, 5 licenciadas en obstetricia, 2 auxiliares en obstetricia, 10 auxiliares técnicos, 3 técnicos en enfermería, 1 licenciada en Farmacia, 1 técnico en Farmacia, 2 administrativos, 1 peón de patio, 1 electricista, 1 Sereno.

De acuerdo a esta fuente, se desarrollan en el distrito actividades de educación comunitaria con el apoyo del personal de salud, en los centros asistenciales, en los clubes de madres, en capillas y audiciones radiales, esto a fin de fomentar a la población en general acudir a las unidades de salud y llevar una vida saludable.

Según datos brindados por los pobladores de las localidades visitadas en el marco del trabajo de campo se presta actualmente los siguientes servicios:

Todas las consultas de carácter no respiratorio como Hipertensos y pacientes crónicos.

- Urgencias leves y se deriva de acuerdo al caso.
- Control prenatal
- Testeo rápido VIH Sida Hepatitis B, Chagas (de carácter voluntario) pero para las embarazadas y sus parejas son obligatorias.

- Vacunación de niños, ancianos y adultos,
- Consultas domiciliarias
- Test para recién nacidos.

Según indicaron, se realiza atención primaria en la comunidad, buscando que sea una atención integral (“vemos todo, si hay violencia intrafamiliar, los que fuman o los que son alcohólicos”).

Acceso a tecnologías de información y medios de comunicación (TIC) y bienes de confort

Con relación al acceso a TIC, según los datos facilitados por la DGEEC, en el Distrito de Loreto, el 83,2% de las viviendas cuentan con radio; del 80,0% de las viviendas que cuenta con televisor, el 8,2% tiene TV cable; el 4,4% de las viviendas cuentan con teléfono fijo; el 84,1% de las viviendas con teléfono celular; y del 5,4% de viviendas con computadora, el 4,3% tiene conectado a internet; el 5,4% de las viviendas cuenta con antena parabólica.

Tabla 57. Equipos domésticos y TIC

Acceso a TIC	Departamento de Concepción	Distrito de Loreto
Viviendas particulares ocupadas con personas presentes	42.402	3.063
% Viviendas con radio	80,6	83,2
% Viviendas con televisor	79,8	80,0

% Viviendas con TV cable	13,4	8,2

Fuente: STP/DGEEC. Censo Nacional de Población y Viviendas, 2012.

A través del trabajo de campo se pudo acceder a información respecto a los siguientes medios de comunicación como:

- Tipo de medios de comunicación utilizados: Radio, Televisión, Celulares, Redes Sociales.
- Emisoras radiales: Radio Cristiana 107.5 Misión de Dios, Tekopyahu de Loreto, Regional AM de Concepción, Ypané de Concepción, Radios de Paso Barreto y Arroyito, la 89.9 de Horqueta, Radio Aquidabán
- Canales de televisión: Canal 9 SNT, Telefuturo y canales por cable y antena satelital.
- Celulares con internet: a través de mensajería, llamadas y grupos de whatsapp (en algunas comunidades se cuenta con mala conexión a internet)

En relación a los bienes de confort en las viviendas del Distrito de Loreto, según datos entregados por la DGEEC, el 64,2% de las viviendas cuentan con heladeras; el 44,8% con lavarropas; el 16,3 % con video/DVD; el 2,2% con termo-calefón; el 16,0% con ducha eléctrica; el 6,4% con aire acondicionado; el 11,7% con horno microondas; el 5,0% con automóvil/camioneta y el 73,8% con moto.

Tabla 58. Equipos domésticos y bienes de confort

6. Distrito de Arroyito

6.1. Características generales

Municipalidad de Arroyito Fuent^ea: La Nación.⁸³

Arroyito es un distrito ubicado en la zona este del departamento de Concepción, a 78 kilómetros de la capital departamental. El 22 de noviembre del año 2016 fue declarado distrito, separándose de Horqueta, por Ley N° 5.742. Se encuentra al norte de la capital del país, Asunción, a 390 Kilómetros y las principales vías de comunicación terrestre que conectan a ambas ciudades son las rutas 3 “General Elizardo Aquino” y 5 “General Bernardino Caballero”.

Según se indica en una de las fuentes de consulta “Desde el año 2013 su población inició la cruzada para lograr la autonomía distrital alegando el notorio crecimiento poblacional⁸⁴” lo que implicó posteriormente la desafectación de una superficie de aproximadamente 88.000 hectáreas que dependían del distrito de Horqueta (880 km2). En cuanto al gobierno municipal, el intendente y concejales municipales fueron electos en el mes de marzo del 2017, según lo establecido por el Tribunal Superior de Justicia Electoral (TSJE).

6.2. Datos de Población

Según datos de la DGEEC, la proyección de población del Departamento de Concepción es de 254.976, perteneciendo al Distrito de Arroyito 13.181 habitantes. Esta totalidad representa el 5,16% de la población del departamento.

De estos datos publicados, se puede notar un pequeño aumento en la proyección de la población del distrito de Arroyito en los siguientes 5 años, presentados en la siguiente tabla.

Tabla 59. Evolución de la población en los siguientes 5 años (2020-2025)

Departamento y distrito	Año					
	2020	2021	2022	2023	2024	2025

Según se indica en una de las fuentes consultadas, el sector urbano del distrito se encuentra poco desarrollado. Cuenta con 2 asentamientos campesinos que representan a más de la mitad de su población, como ser el asentamiento Arroyito con sus 6 núcleos (barrios). Este distrito cuenta con las siguientes compañías: Calle 13 Mata Burro, Calle 14-Zona Norte (San Antonio, Zona Sur (San Agustín), Calle 15, Calle 16, Calle 17, Calle 18, Arroyito, Acapitigo, Tacuara, Cuero Fesco, Arroyo de Oro y Primavera.

Necesidades Básicas Insatisfechas (NBI)

Tomando como fuente a la DGEEC, tanto en el tríptico de Necesidades Básicas Insatisfechas (NBI)⁸⁶, como en los datos sobre Medición de las NBI a partir del Censo Nacional de Población y Viviendas 2012⁸⁷, se indica que en el Distrito de Arroyito el 68,6% de los hogares cuenta con al menos una NBI; el 40,5% de hogares con NBI en infraestructura sanitaria; el 33% de los hogares con NBI en acceso a la educación; el 17,5% de los Hogares con NBI en capacidad de subsistencia y el 17,4% de los hogares con NBI en calidad de la vivienda. A continuación, pueden observarse las cifras en la siguiente tabla.

Tabla 61. Hogares con NBI, según departamento y distrito

Salud

Según datos extraídos de la página oficial del MSPyBS, el Distrito de Arroyito cuenta con 4 Unidades de Salud de la Familia y 1 Puesto de Salud⁹⁷, se citan a continuación:

- USF - Arroyito (Ruta 5)
- USF - Cuero Fresco
- USF - Asentamiento Arroyito Núcleo 3
- USF - Asentamiento Arroyito Núcleo 6
- Puesto de Salud - Asentamiento Arroyito Núcleo 7

Itaipú Binacional⁹⁸ financió en el distrito de Arroyito la construcción de 1 USF que fue inaugurada en el mes de agosto de 2020. La infraestructura de la misma cuenta con consultorios clínico, pediatrónico y ginecológico, sala de parto, sala de rayos x, cocina, comedor y servicios sanitarios totalmente renovados y adecuados a personas con discapacidad, dispone de equipamientos médicos para cirugías menores y curaciones, estufa para esterilización, otoscopio, estetoscopio, oftalmoscopio, camilla ginecológica, balón de oxígeno, entre otros instrumentos y cuenta con un acceso para ambulancias a fin de facilitar el traslado de pacientes a otros centros de mayor complejidad, buscando cubrir la salud preventiva de al menos 5.000 pobladores.

Acceso a Tecnologías de información y medios de comunicación (TIC) y bienes de confort.

En relación al acceso a TICs, los datos facilitados por la DGEEC indican que en el Distrito de Arroyito, en la mayoría de las viviendas cuentan con teléfonos celulares, con radio y con televisor; y en menor proporción cuentan con antenas parabólicas, con computadoras; con internet, TV cable y teléfonos fijos, como se puede observar en la siguiente tabla:

Tabla 66. Equipos domésticos y acceso a TIC

Acceso a TIC	Departamento de Concepción	Distrito de Arroyito

7. Distrito de Horqueta

7.1. Características generales

Acceso ciudad de Horqueta⁹⁹

Horqueta se encuentra ubicada a 50 Km de la Ciudad de Concepción y a 434 km¹⁰⁰ de Asunción, a 172Km de Punta Porá (Brasil). Limita al norte con los distritos de Loreto, Concepción y el Río Aquidaban, al sur con el Río Ypané, al este con el distrito de Yby Yaú y al oeste con los distritos de Concepción y Belén. Contaba con una superficie de 2.925 Km2 (antes de la distritación de Arroyito), distribuidas en zonas urbanas y rurales¹⁰¹. Desde el año 1917 al año 2001 se crearon 22 colonias, correspondientes a 6.957 lotes y 124.391 hectáreas¹⁰². Actualmente, cuenta con una superficie de 1.386 km2.

La mayor parte de la población (75%)¹⁰³ habita en el área rural y el 98% se dedica a la agricultura y ganadería. Existen asentamientos y una comunidad indígena en el distrito y los caminos de acceso a las comunidades en su mayoría son de tierra y se encuentran en mal estado, con grandes distancias para llegar a la zona urbana.

La ciudad de Horqueta fue fundada el 10 de mayo de 1793, por Juan Manuel Gamarra con ayuda del Sacerdote Andrés Salinas.¹⁰⁴

Según datos del municipio¹⁰⁵ la ciudad tuvo su origen como capilla, en el siglo XVIII, fundada oficialmente en el año 1793. Fue la primera ciudad con calle peatonal del país. La ciudad lleva el nombre de Horqueta, porque se encuentra situada en la bifurcación de caminos, de ahí deriva su nombre.

Toponimia: El nombre de la ciudad se debe a que la misma nació del cruce de caminos, llamado “Tape Horqueta”, lugar donde acampaban carretas después de largos viajes.

Los habitantes de las localidades de Paso Mbutu, Calle 15 y Domínguez Nigó, dependientes del distrito, que han participado de la consulta, han mencionado que el lugar es muy tranquilo y seguro,

que existe unidad y solidaridad y que se conocen entre todos en la zona. Tienen una alta valoración el río y la naturaleza.

Entre las festividades del distrito han mencionado aquellas vinculadas al ámbito religioso, como fiestas patronales, procesiones y misas. Igualmente, fechas fundacionales y fechas específicas como día del niño y de la juventud. Según mencionaron en Paso Mbutú, en temporada de verano, especialmente en navidad y año nuevo el atractivo principal es la Playa. Esta es gestionada y administrada por la comisión vecinal.

Otras actividades son desarrolladas en clubes de personas con diabetes e hipertensión y de madres, organizadas por la USF.

Asimismo, torneos de futbol femenino y masculino, laceada, carreras de caballero, vóley, llano, conocido comunitariamente como “carrera yvýrupí” (carrera a pie), actividades de la cooperadora escolar para recaudar fondos en el caso de Calle 15 y en Domínguez Nigó se mencionó entre otras actividades de recreación, la pesca en el río Aquidabán.

7.2. Datos de Población

Según datos de la DGEEC, la proyección de población del Departamento de Concepción es de 254.976, perteneciendo al Distrito de Horqueta 62.664 habitantes. Esta totalidad representa el 24,58% de la población del departamento. Horqueta está conformado por 32.477 hombres y 30.187 mujeres (Proyección 2020)¹⁰⁶. Como puede observarse en la siguiente tabla en su mayoría, es decir, el 51,83% de la población del distrito está conformada por hombres y el 48,17 % está conformada por mujeres.

Tabla 68. Proyección estimada de la población de la de Horqueta, por sexo. Año 2020

Distrito de Horqueta	Población	Porcentajes
Hombres	32.477	51,83
Mujeres	30.187	48,17
Total (ambos sexos)	62.664	100
% Población Total del Departamento	254.976	24,58

Fuente: Elaboración propia en base a datos de la DGEEC. Dpto. Concepción. Población estimada y proyectada, según distrito, sexo y grupos de edad, 2000-2025

Como se puede observar en la siguiente tabla sobre proyecciones de evolución/crecimiento de la población, la diferencia en la relación cantidad hombres/mujeres, señal que en su mayoría son hombres y se ha mantenido en los últimos 5 años.

Tabla 69. Evolución de la población de Horqueta en los últimos 5 años (2016-2020)

Distrito Horqueta	2016	2017	2018	2019	2020
Hombres	31.157	31.492	31.823	32.152	32.477
Mujeres	28.874	29.199	29.526	29.856	30.187

7.3. Economía

Según datos expuestos en el Plan Local del Distrito de Horqueta, la economía de este distrito se basa preponderantemente en la agricultura y comercios e industrias. Sus habitantes se dedican a actividades como la plantación de ka'a he'ê, algodón, tártago, poroto, mandioca, maíz, entre otros. Se observa explotación forestal y trabajo en aserraderos, curtiembres, aceiteras, desmontadoras de algodón y productos del agro¹¹¹.

Según los datos proveídos por la DEGEEC, el Sector Económico de la población ocupada es la Población ocupada de 12 años y más de edad que pertenece a una rama de actividad específica, donde el sector primario comprende a la agricultura, ganadería, caza y pesca; el sector secundario abarca las industrias manufactureras, construcción, minas y canteras; el sector terciario agrupa a electricidad, gas y agua, comercio, restaurantes y hoteles, transporte, almacenamiento y comunicaciones, finanzas, seguros, inmuebles, servicios comunales, sociales y personales; y no informado¹¹².

Actividades económicas

Según datos proveídos por la DGEEC, en el Distrito de Horqueta predominan las actividades económicas relacionadas al sector primario con 53,5%, seguidamente la del sector terciario con el 34,7% y finalmente con menor porcentaje el sector secundario con 11,3%, como se puede observar en la siguiente tabla.

Tabla 75. Población ocupada por sector económico

Datos de Población	Departamento de Concepción	Distrito de Horqueta
Sector económico de la población ocupada	226.585	46.029
% Primario	40,9	53,5
% Secundario	15,7	11,3

Las personas consultadas de las localidades han señalado que las actividades principales en torno a la economía están centradas en la ganadería, pequeña ganadería y todas las actividades relacionadas a estas por las estancias que están ubicadas en la zona. La modalidad es por jornal o por trato/trabajo (una persona contratada por la empresa/estancia subcontrata personales por un tiempo determinado).

Asimismo, indicaron como actividad productiva, la pesca y el trabajo artesanal en la elaboración de sombreros, redes de pesca y tarrafa a través del comité de producción.

Además, de los pequeños comercios en la comunidad (despensas, copetines, mecánico).

En la Localidad de Calle 15, los pobladores mencionaron como principal actividad económica a la agricultura, cuentan con plantaciones de sésamo, feijao, sandia y piña, para consumo y venta. *Se habían dedicado a la plantación de eucalipto, pero no prosperó.* Otra de las actividades es el trabajo a través de la pequeña ganadería.

En la localidad de Dominguez Nigó, según los habitantes que participaron de la consulta, la actividad económica principal es la producción y venta de sombreros de caranday, se pueden dar tres formas de trabajo con relación a esta, de manera individual, por asociación o trabajando para un patrón. Generalmente el mercado de salida es Pedro Juan Caballero. Otra opción es la albañilería, el trabajo en las estancias, ya sea de capataz o jornalero, pero no es frecuente.

Y la chacra es utilizada para autoconsumo; plantan mandioca, maní y caña de azúcar. La pequeña ganadería y el tambo son opciones para el permute de artículos en las despensas y pequeños comercios.

Otros pobladores se desempeñan como funcionarios públicos en las escuelas y colegios, registro civil, USF y Policía nacional.

7.4. Acceso a servicios

Acceso a servicios básicos

Referente al acceso a servicios básicos en el Distrito de Horqueta, los datos proveídos por la DGEEC reflejan que el 93,0% de las viviendas cuenta con energía eléctrica; el 72% cuenta con agua corriente; el 34,8% de viviendas con saneamientos mejorados; el 10,5% con servicio de recolección de basura y ninguna de las viviendas accede al desagüe cloacal en el distrito, como se puede observar en la siguiente tabla:

Tabla 76. Viviendas con Acceso a Servicios Básicos

Datos de viviendas particulares	Servicios básicos	Departamento de Concepción	Distrito de Horqueta
Viviendas particulares ocupadas con personas presentes		42.402	8.761
% Viviendas con energía eléctrica		93,1	93,0
% Viviendas con agua corriente ¹¹³		74,4	72,0
% Viviendas con desagüe cloacal ¹¹⁴		6,3	-
% Viviendas con recolección de basura		22,8	10,5
% Viviendas con saneamiento mejorado		46,9	34,8

Fuente: STP/DGEEC. Censo Nacional de Población y Viviendas, 2012.

En cuanto a la disposición de residuos sólidos, el Plan Local de Salud de Horqueta señala que el distrito cuenta con un vertedero municipal para la disposición y el tratamiento de las basuras; sin embargo, sólo una parte de la zona urbana accede al servicio de recolección, en la zona rural los medios de eliminación de residuos practicados comúnmente por la población son la quema y el entierro.

Esto pudo confirmarse durante el trabajo de campo, ya que los pobladores involucrados respondieron que no se cuenta con el servicio y que se procede a la quema o al entierro en hoyos. Igualmente, se confirmó que el uso de letrinas en la zona es aún mayoritario como también se afirma en el Plan Local de Salud, en el que se señala que sólo el 16 % de la población en la zona urbana de Horqueta cuenta con baños modernos, mientras que, en mayor proporción, el 72 % correspondiente a la zona rural utilizan letrinas sanitarias.

En cuanto al acceso al agua potable, las tres localidades consultadas tienen distintas formas de acceso.

En la localidad de Paso Mbutu, los habitantes señalaron que no cuentan con agua potable y corriente. La gran mayoría de la comunidad utiliza el agua de pozo para el riego y lavado de cubiertos ya que sale salada y para el consumo traen de una naciente, a la que denominan chorro o yvu, otra alternativa es acumular el agua de lluvia en bidones 100 o 200 litros; o pagar 20 mil por bidón para abastecimiento.

En la localidad de Calle 15, las personas han dicho que el acceso es a través de pozos particulares, en algunos casos comparten. Existen familias que usan el agua de tajamar diariamente.

¹¹³ Incluye: ESSAP, SENASA, red comunitaria, red privada, y pozo artesiano, con cañería fuera de la vivienda, pero dentro del terreno o con cañería hasta la cocina y/o baño.

¹¹⁴ Incluye: Desagüe por red pública, pozo ciego con y sin cámara séptica.

Tajamar- Calle 15. Fuente: Registro fotográfico de trabajo de campo. Equipo consultor. Concepción. Agosto -septiembre 2020.

Y, en la localidad de Domínguez Nigó indicaron que acceden al agua a través de un pozo artesiano gestionado a través de la Gobernación. El agua es tratada con cloro y la gran mayoría de las familias accede a ella.

Ninguna de las comunidades consultadas accede a la red desagüe cloacal.

*Disposición final de Residuos- Calle 15
Fuente: Registro fotográfico de trabajo de campo. Equipo consultor. Concepción. Agosto -Septiembre 2020.*

En relación al uso de Pozo séptico/Letrina/Otro, en las comunidades más de la mitad de la población aun utiliza letrina.

Con respecto al tratamiento de la basura han mencionado que ninguna de las localidades cuenta con servicios de recolección de basuras, estas son quemadas o tiradas en hoyos, confirmando así los datos mencionados por la DGEEC/STP del censo 2012.

Según los datos publicados en el Plan de Desarrollo Municipal de Horqueta, el acceso a energía eléctrica es suministrado por la Sub Estática de Costa Romero ubicada a 3km de Horqueta y procesa la energía de la Central Hidroeléctrica de Itaipú, aunque de las localidades de Horqueta involucradas a la consulta, los pobladores han indicado que la totalidad de la población cuenta con energía eléctrica a través de la ANDE.

Educación

En relación a la educación en el Distrito de Horqueta, según los datos del Ministerio de Educación y Ciencias (MEC)¹¹⁵ y la Guía Completa de Educación en Paraguay¹¹⁶, se encuentran 86 establecimientos educativos, de los cuales 17 se encuentran en el área urbana y 69 en el área rural. De la totalidad, 40 instituciones con modalidad de Educación Inicial (32 en el área rural y 8 en el área urbana); 83 instituciones con modalidad de Educación Escolar Básica (11 en el área urbana y 72 en el área rural); 20 instituciones con modalidad de Educación Media (3 en el área urbana y 17 en el área rural). Así mismo se pueden ver en la siguiente tabla.

Tabla 77. Nivel educativo según zona de ubicación

Nivel educativo Distrito Horqueta	Total	Zona	
		Urbana	Rural
Educación inicial	40	8	32
Escolar Básica	83	11	72
Educación media	20	3	17
Total	143	22	121

Fuente: elaboración en base a los datos del MEC- Datos abiertos, Establecimientos escolares 2019 y la Guía Completa de Educación en Paraguay.

Con respecto a la educación superior, en el distrito de Horqueta existen varias instituciones universitarias, públicas y privadas, como se indica en el informe de estudios sociales del componente industrial, entre ellas figuran, Universidad Tecnológica Intercontinental (UTIC), Universidad San

Carlos, Universidad Nacional de Concepción (UNC), la Universidad Politécnica y Artística del Paraguay (UPAP). Asimismo, el Instituto de Formación Docente de Horqueta (IFD Horqueta).

Se identifica una variedad de carreras de grado y posgrado ofrecidas por estas instituciones, entre ellas se destacan las carreras relacionadas a la Agronomía, Ciencias de la Educación, Administración, Contabilidad, Informática, entre otras vinculadas a la salud, como Medicina, Enfermería, Nutrición y otros.

Formación profesional y técnica

En lo que refiere al acceso a la formación profesional y técnica, dentro del Departamento de Concepción se observan varias ofertas de enseñanza en instituciones públicas y privadas. Según los datos extraídos de la página oficial de SINAFOCAL, en el distrito de Horqueta está planificado impartir cursos de “Cocina y Repostería”.

Se presentan a continuación otras ofertas de formación profesional y técnica que existen en el distrito de Horqueta.

Salud

USF Paso Mbutu- Fuente: Registro fotográfico de trabajo de campo. Equipo consultor. Concepción. Agosto -septiembre 2020

Con respecto a los servicios de salud, según los datos del Ministerio de Salud Pública y Bienestar Social (MSPYBS), en el Distrito de Horqueta existe; 1 Hospital Distrital y 11 Unidades de Salud de la Familia. Los siguientes centros asistenciales son:

- Hospital Distrital de Horqueta
- USF- Santa Librada
- USF- Paso Mbutú
- USF- Naranjaty
- USF- Peguajhó Loma
- USF- Capitán Giménez
- USF- Alfonso Cué
- USF- Capitán Sosa
- USF- Curupa'y Loma
- USF- Alemán Cué
- USF- Ybyraty-Brasil Cué
- USF- Totora

En el Plan Local de Salud se menciona que en la Localidad de Horqueta y sus alrededores se cuenta con 7 Puestos de Salud:

- Puesto de Salud Capitán Sosa
- Puesto de Salud Purity San Carlos
- Puesto de Salud Arroyito Núcleo 7
- Puesto de Salud Calle 13 San Ignacio
- Puesto de Salud Cuartelero
- Puesto de Salud Paso Mbutu
- Puesto de Salud Ykua Hovy

Puesto de Salud Cuartelero -Fuente: Registro fotográfico de trabajo de campo. Equipo consultor. Concepción. Agosto -Septiembre 2020.

Según datos proveídos por la Primera Región Sanitaria, en el año 2018 existían 76 establecimientos de salud en todo el departamento de Concepción, de los cuales 15 se encuentran en el distrito de Horqueta (servicios públicos confirmar) y 1 clínica privada (San Antonio).

Según datos brindados por los pobladores de las localidades visitadas en el marco del trabajo de campo, se confirmó que hay 1 USF en Paso Mbutu (1 Doctor, 1 Lic. En Enfermería, 2 Técnico Superior en Enfermería y 1 Agente Comunitario). Programas de Vacunación, PANI, Planificación y papa Nicolau, Control prenatal, Control crecimiento y desarrollo, Prevención Its, Hipertensión y diabetes, Tuberculosis y otras. Las problemáticas más frecuentes de salud son la hipertensión y parasitos por el uso de letrina y el uso del agua que no es agua potable.

Los pobladores de Calle 15 consultan en esta USF porque queda a una distancia de 8km y si no se encuentra el doctor acuden al Puesto de Salud de Arroyito a 12 km. Los habitantes de Domínguez Nigó consultan en el Puesto de Salud de Cuartelero, les queda a una distancia de 10 km, cuentan con

un médico de familia y 4 licenciadas. Realizan visitas, desarrollan charlas educativas a los alumnos y reuniones con el grupo de mujeres.

Para los casos graves acuden a Horqueta o Concepción (distancia a Horqueta: 40 km de la ruta y Concepción: 80km).

Acceso a Tecnologías de información y medios de comunicación (TIC) y bienes de confort

Atendiendo a los datos facilitados por la DGEEC, con relación al acceso a TICs, puede señalarse que la gran mayoría de las viviendas en el distrito cuentan con teléfono celular, seguidamente de radio y televisor; en menor proporción las viviendas poseen TV cable, computadoras, antenas parabólicas, computadoras conectadas a internet y teléfono fijo, como puede observarse en la siguiente tabla.

Tabla 80. Equipos domésticos y TIC

Acceso a TIC	Departamento de Concepción	Distrito de Horqueta
Viviendas particulares ocupadas con personas presentes	42.402	8.761
% Viviendas con radio	80,6	76,9
% Viviendas con televisor	79,8	75,4
% Viviendas con teléfono fijo	8,0	5,2
% Viviendas con teléfono celular	83,3	83,7
% Viviendas con computadora	11,9	7,7
% Viviendas con computadora conectada a internet	9,2	5,3
% Viviendas con antena parabólica	10,8	6,3
% Viviendas con TV cable	13,4	15,7

Fuente: STP/DGEEC. Censo Nacional de Población y Viviendas, 2012.

Los habitantes de las localidades consultadas (Paso Mbutu, Calle 15 y Domínguez Nigó) han indicado que los medios de comunicación más utilizados son: radio, televisión, celulares y redes sociales; de los cuales mencionaron como emisoras radiales a Radio Arroyito Récord 96.5, Radio Cristal y la 102.5 de Arroyito; Guyra Campana 102.5 y la 89.9 de Horqueta; Radio Los ángeles y Radio Regional; a canales de televisión: Canal 9 SNT, Telefuturo y canales por cable y Celulares con internet: a través de mensajería, llamadas y grupos de whatsapp (mencionaron que en la zona hay mala conexión a internet).

Así mismo, la DGEEC proporcionó información con relación al acceso de la población del Distrito de Horqueta a los bienes de confort en las viviendas, estos datos señalan que gran porcentaje de las viviendas cuentan con motocicletas, seguidamente cuentan con heladeras y lavarropas, luego en menor porcentaje las viviendas poseen ducha eléctrica, video/DVD, aire acondicionado, automóvil/camioneta, horno microondas y termocalefón, como se puede observar en la siguiente tabla.

Tabla 81. Equipos domésticos y Bienes de confort

Bienes de confort	Departamento de Concepción	Distrito de Horqueta
Viviendas particulares ocupadas con personas presentes	42.402	8.761
% Viviendas con heladera	68,1	62,2
% Viviendas con lavarropas	50,9	44,5
% Viviendas con video/DVD	21,2	16,1
% Viviendas con termocalefón	4,0	3,7
% Viviendas con ducha eléctrica	25,7	19,9
% Viviendas con acondicionador de aire	15,2	8,8
% Viviendas con horno microondas	14,4	7,4
% Viviendas con automóvil/camioneta	9,9	8,5
% Viviendas con moto	74,3	72,3

ANEXO 4: FICHAS DE COMUNIDADES IDENTIFICADAS

El presente anexo contiene datos proporcionados por referentes del nivel local durante el proceso de consulta. Estos elementos han sido sistematizados en formato de fichas teniendo en cuenta variables socioeconómicas, culturales e históricas; a fin de visualizar un perfil específico de las comunidades de estudio.

Con miras a la caracterización del territorio se detalla información correspondiente a un total de 16 comunidades. Las mismas fueron identificadas a partir de los accesos principales¹y/o la cercanía a los campos forestales prospectados, que se encuentran localizados en los departamentos de Concepción y Amambay.

A continuación se presentan las comunidades de estudio. Cabe señalar que el orden establecido se definió en función a los accesos principales.

Mapa Acceso Loreto-Paso Barreto

A partir de esta vía se encuentran las comunidades de: Virgen del Camino, Santísima Trinidad, Hugua Po'i, Jhugua Guazú, Islería, Laguna Cristo Rey, Anderí y Paso Barreto.

¹ Ver Mapa- Principales vías de acceso vinculadas al proyecto- Estudios Sociales Componente Forestal 2020.

Virgen del Camino

Información general

Zona: Rural

Distancia del centro urbano: A unos 26 km de la ciudad de Concepción (Loreto-Paso Barreto)

Municipio del cual depende: Loreto

División del territorio: Virgen del Camino

Límites: Santísima Trinidad, Hugua Po'i, Loreto, Torales San Roque, Laguna Mobohapy, Caacupemí

Principales vías de acceso: Ruta Loreto - Paso Barreto.

Habitantes: 281 personas

Cantidad de familias/viviendas: Alrededor de 100 familias y 75 viviendas

Comunidades indígenas: No hay comunidades indígenas en la zona.

Aspectos históricos

Se la conoce como Virgen del Camino en honor a la Santa Patrona de la comunidad. Empezó a poblar desde hace más de 60 años. En sus inicios había aproximadamente unas 30 familias; instaladas principalmente en la zona más próxima a la localidad de Santísima Trinidad.

Los primeros pobladores eran oriundos de las localidades de Ykua Porâ, Cañada la Paz, Jhuga Bonete y Ciudad del Este; siendo los Guerrero, Guerrero Vázquez y Cristaldo parte de las primeras familias en asentarse en la zona.

Actualmente el territorio se extiende desde la casa de don Apolonio Rojas hasta la casa de la familia Guerrero.

Entre los aspectos positivos se señalan: accesibilidad a la ruta, tierra apta para la agricultura y la ganadería, libertad de culto, suficiente abastecimiento de agua, tranquilidad, armonía y el buen relacionamiento entre vecinos.

Principales actividades económicas

- Se dedican principalmente a la agricultura y la pequeña ganadería (vacas, cabras).
- Producen además para venta: leche, queso, huevo. Por lo general estos productos se venden en la ciudad de Loreto.
- Trabajo en las estancias: Quienes se dedican a esta actividad van a las estancias del Chaco o trabajan en las estancias cercanas por jornal o por trato.
- Comercio: existen además pequeñas despensas, bodegas, sitios de venta de combustibles, lavadero, gomería.

Situación del empleo: En la zona predomina la falta de fuentes de trabajo y la mayoría se emplea como jornalero haciendo changas. Aproximadamente el 40% de los que terminan sus estudios secundarios continúan formándose.

Despensa- Virgen del Camino

Actividades recreativas

- **Fiesta Patronal:** El 5 de octubre se celebra el día de la Virgen del Camino. En la misma fecha se recuerda además el Día del Camino. Se realizan festivales, rezo, procesión o santo corrido.
- **Club Hípico:** Jineteada
- **Torneo campesino:** participan las comunidades cercanas y es organizado a nivel parroquial.
- **Balnearios:** Las personas acuden a los balnearios de las zonas cercanas tales como: Balneario Itá, Paso Horqueta, San Josemi, María Auxiliadora.
- **Otras actividades:** Se organizan actividades para recaudar fondos a través de las cooperadoras escolares (ACE) y se celebra el día del niño.

Medios de comunicación

- **Radio:** Cristiana. 107.5 Misión de Dios. Se escucha hasta la ribera del río Paraguay, Paso Horqueta y Carayá Vuelta.
- **TV:** Por antena de Claro, principalmente.
- **Celular:** La mayoría tiene acceso a internet. La principal forma de comunicación es a través de WhatsApp.

Organizaciones / Asociaciones

- Comisión vecinal Virgen del Camino
- Junta de Saneamiento Virgen del Camino
- Comité de mujeres productoras Mburukua Poty
- Delegados de base de Iglesia Católica
- Comité de agricultores
- Docentes agremiados a la OTEP y SINADIS
- Asociados a la FNC y Tekopyahu

Principales problemáticas económicas, sociales y culturales

- Pobreza y desigualdad: asociada principalmente a las necesidades existentes en la zona
- Falta fuentes de trabajo en la comunidad
- Trabajos esporádicos y mal remunerados
- Falta apoyo a la producción campesina, asistencia técnica, capacitación, fortalecimiento y generación de canales de comercialización
- Abigeato
- Bajo porcentaje de personas acceden a la universidad
- Deserción escolar
- Embarazo precoz

Aspectos necesarios para un mayor desarrollo

- Acceder a capacitaciones y oportunidades laborales
- Apoyo y fortalecimiento para los comités productivos
- Personal médico para mejorar la cobertura y atención
- Priorizar el acceso a una educación de calidad en todos los niveles formativos
- Iniciar con los trabajos para asfaltar la ruta que une Loreto con Paso Barreto

Acceso a servicios básicos

- **Agua potable:** La comunidad cuenta con 3 pozos para el abastecimiento de agua. El primer pozo solo se utiliza para lavar ropa y para los animales debido a que el agua es de color rojo, de esta dependen alrededor de 18 familias.
- **Red de desagüe:** No se cuenta con red de desagüe en la comunidad.
- **Pozo-Letrina:** La mayoría de las viviendas tienen baños con pozo ciego.
- **Medio de transporte:** El medio de transporte principal es la motocicleta. En la zona cuentan con servicio de ómnibus (privado)
 1. Paso Barreto - Concepción
 2. Puentesiño- Concepción: día de por medio.
- **Tratamiento de basura:** No se cuenta con servicio de recolección de basura. En mayor porcentaje queman y en menor proporción depositan en hoyos.
- **Energía eléctrica:** Proveída por la ANDE.

Instituciones y sitios de interés

Santísima Trinidad

Información general

Zona: Rural

Distancia del centro urbano: A unos 30 km de la ciudad de Concepción (Loreto-Paso Barreto)

Municipio del cual depende: Loreto

División del territorio: Santísima Trinidad

Límites: Hugua Po'i, Jhugua Rivas, Virgen del Camino- La ruta Loreto-Paso Barreto

Principales vías de acceso: Ruta Loreto - Paso Barreto / Jhugua Rivas La Asunción

Habitantes: 619 personas en Hugua Po'i y Santísima Trinidad

Cantidad de familias/viviendas: Alrededor de 35 viviendas

Comunidades indígenas: No hay comunidades indígenas en la zona.

Aspectos históricos

Esta localidad se conformó entre los años 1968 y 1970, tras dividirse de la comunidad de Hugua Po'i.

Los primeros pobladores fueron Juan Pio Martínez, Florencio López, Manuel Reguera y Vidal Medina; quienes provenían de la zona de Hugua Po'i.

La llamaron Santísima Trinidad en honor al dogma que establece el trino divino. En el año 2002 se construyó el templo y en el 2004 la escuela. Ambas edificaciones llevan el mismo nombre que la comunidad.

En la actualidad, hay aproximadamente unas 35 casas desde el pozo artesiano que está sobre ruta, hasta el cruce que conecta con la localidad de Jhugua Rivas de la Asunción.

Entre los aspectos positivos se señalan: tranquilidad, poco flujo vehicular, seguridad, participación comunitaria, tierra apta para producción y el hecho de ser una comunidad unida.

Principales actividades económicas

- La actividad principal es la agricultura y ganadería en pequeña escala; para consumo y también para venta.
- Un porcentaje de la población trabaja en las estancias del Chaco por jornal o por trato.
- Hay personas empleadas en el frigorífico que se trasladan diariamente a la capital departamental.
- También hay un sector que se dedica a la producción de miel de caña y ka'i ladrillo (dulce de maní), otros a la venta de leche y elaboración de queso.
- Asimismo, se menciona que existen pequeñas despensas que aportan al sustento familiar.

Actividad productiva: ganadería

Situación del empleo: Migración de jóvenes en busca de ofertas laborales y educativas. Se prefiere trabajar en las estancias del Chaco porque se recibe mejor remuneración que en las estancias de la zona. En el caso de la agricultura, el rubro de renta principal es el feijao. Se menciona, además, que varios productos dejaron de ser rentables debido a los bajos precios de venta.

Actividades recreativas

- **Fiesta patronal:** El 15 de junio es el día de la Santísima Trinidad, y la comunidad organiza fiestas y festivales en conmemoración.
- **Otras fiestas religiosas:** Día de San Antonio, María Auxiliadora, Caacupé, Divino Niño. Estas festividades son organizadas por familia, y participa la comunidad.
- **Club Hípico:** Se realizan carreras de caballo de manera semanal o quincenal. A la actividad asisten pobladores de la zona y de las ciudades de Concepción, Horqueta y San Alfredo.
- **Deportes:** Se realizan torneos de futbol, vóley masculino y femenino.

Medios de comunicación

- **Radio:** Tekopyahu de Loreto
- **TV:** Canal 9, Telefuturo. La gente que tiene antena de Claro o Tigo ve otros canales.
- **Celular:** La mayoría tiene acceso a internet. La principal forma de comunicación es a través de WhatsApp.

Organizaciones / Asociaciones

- Comisión vecinal Santísima Trinidad
- Delegados de base de Iglesia Católica
- Comisión de agua (No a través de SENASA)
- Asociación de Cooperadora Escolar (ACE)
- Comité de Tekoporâ

Principales problemáticas económicas, sociales y culturales

- Pobreza
- Falta fuentes de trabajo en la comunidad
- Comercialización de la producción campesina a bajo precio
- No hay mercado seguro para la comercialización de productos.
- Caminos en mal estado
- Se necesita ampliar los niveles de educación escolar. Solo se cuenta hasta el 6º grado en la comunidad.
- Red de abastecimiento de agua insuficiente

Aspectos necesarios para un mayor desarrollo

- Fuentes de trabajo
- Mejorar la red vial comunitaria
- Mercados seguros para la comercialización de productos de la agricultura familiar campesina a precios justos
- Ampliar la red de abastecimiento de agua de la comunidad
- Ampliar la cobertura de niveles educativos hasta el 9º grado

Acceso a servicios básicos

- **Red de abastecimiento de agua:** En la comunidad existen dos pozos artesianos (uno en la entrada sobre ruta que no se usa porque el agua posee un color rojo cobrizo y otro instalado en el predio de la escuela). Alrededor de seis familias no se abastecen del sistema por estar en zonas altas donde la presión del agua no es suficiente. Estas acarrean agua para consumo de los vecinos más cercanos. También tienen pozo en los hogares, pero durante la época de sequía no abastecen.
- **Red de desagüe:** No se cuenta con red de desagüe en la comunidad.
- **Pozo-Letrina:** Predomina el uso de letrinas (25 familias), y algunos hogares tienen baños con pozo ciego.
- **Medio de transporte:** Tienen acceso a ómnibus de empresas privadas desde la ruta Loreto-Paso Barreto, pero no se utiliza de manera frecuente. El medio de transporte principal es la motocicleta.
- **Tratamiento de basura:** No disponen de servicio de recolección de basura en la comunidad. Los pobladores queman sus residuos.
- **Energía eléctrica:** Proveída por la ANDE.

Hugua Po'i

Información general

Zona: Rural

Distancia del centro urbano: A unos 32 km de la ciudad de Concepción (Loreto-Paso Barreto)

Municipio del cual depende: Loreto

División del territorio: Hugua Po'i

Límites: Santísima Trinidad, Jhuga Guazú, Ykua Porâ, Cerrito-Naranjaty, Jhuga Rivas La Asunción

Principales vías de acceso: Ruta Loreto-Paso Barreto / Horqueta- Naranjaty Ykua Porâ

Habitantes: 619 personas en Hugua Po'i y Santísima Trinidad

Cantidad de familias/viviendas: 121 viviendas

Comunidades indígenas: No hay comunidades indígenas en la zona.

Aspectos históricos

Antiguamente era zona de paso de carretas y caballos; se estima que desde hace unos 150 años empezó a conformarse la comunidad con pobladores provenientes principalmente de la zona de Ykua Porâ. Entre los pobladores de origen se encuentran los de apellido Pérez. La población antigua está conformada en su mayoría por pobladores de la zona de Ykua Porâ.

Aproximadamente hace unos 180 años atrás, en el año 1840, un extranjero que se encontraba realizando los trabajos para la apertura del camino encontró una imagen de San Rafael, que coincidentemente es el santo patrono del viajero. Para los pobladores fue representativo el hallazgo por lo que se la conoce como Jhuga Po'i San Rafael.

En el año 1950, la comunidad se independizó de la localidad de Jhuga Guazú; periodo en el que también fueron construidos el oratorio y la escuela San Rafael.

Entre los aspectos positivos se señalan: Seguridad, la naturaleza, el lugar. La tierra es apta para la producción, y se tiene acceso a la ruta.

Principales actividades económicas

- Agricultura y ganadería; principalmente para consumo
- Un gran porcentaje de hombres trabaja en las estancias del Chaco, a partir de los 15 años.
- En la tabacalera se emplean mayoritariamente como "capataces" o encargados más que como productores.
- Algunos elaboran productos de limpieza.
- Hay familias subcontratadas por la ANDE para mantenimiento del tendido eléctrico.
- Pequeños comercios tales como: despensas, bodega, taller de motos y otros.

Despensa Copetín-Hugua Po'i

Situación del empleo: Predomina el trabajo en las estancias del Chaco. Se menciona que al menos el 20% es jornalero y también se dedica a la actividad agrícola. Al menos el 1.5% tuvo que emigrar al exterior en busca de fuentes de trabajo.

Actividades recreativas

- **Fiesta patronal:** 24 de octubre, San Rafael
- **Otras fiestas religiosas:** Virgen de Caacupé, San Antonio, María Auxiliadora y Divino Niño
- **Torneos:** Fútbol y vóley (hombres y mujeres)
- **Celebración:** Del Día del Niño y del Día de la Juventud en las escuelas
- **Desde la USF:** Se organizan actividades como charlas educativas, el club de embarazadas y el club de adultos mayores.

Medios de comunicación

- **Radio:** Tekopyahu, Regional, Aquidabán
- **TV:** por antena de Claro principalmente
- **Celular:** La mayoría tiene acceso a internet. La principal forma de comunicación es a través de WhatsApp.

Organizaciones / Asociaciones

- Comisión vecinal
- Comités productivos de mujeres (SAS)
- Grupo juvenil de la iglesia
- Comisión de la iglesia
- Subconsejo de salud
- Comisión de agua

Principales problemáticas económicas, sociales y culturales

- Pobreza y desigualdad
- Falta fuentes de trabajo en la comunidad
- Trabajos esporádicos mal remunerados
- Migración y desarraigo
- Falta apoyo a la producción campesina, asistencia técnica, capacitación, fortalecimiento y canales de comercialización.
- Ausencia de oferta educativa terciaria en la zona
- Deserción escolar
- Problemas de abastecimiento de agua

Aspectos necesarios para un mayor desarrollo

- Formación profesional y generación de oportunidades laborales
- Seguridad laboral y mejor remuneración
- Ampliar la oferta educativa y acceder a una educación de calidad en todos los niveles formativos
- Generar proyectos productivos sustentables para las familias
- Apoyo, formación y fortalecimiento para los comités productivos ya existentes
- Ampliar o mejorar la red de abastecimiento de agua

Acceso a servicios básicos

- **Red de abastecimiento de agua:** En la comunidad cuentan con red de agua potable a través de la Junta de Saneamiento. Se utiliza para consumo y uso cotidiano.
- **Red de desagüe:** No se cuenta con red de desagüe en la comunidad.
- **Pozo-Letrina:** Baños con pozo ciego en la mayoría de las casas. Se estima que el 20% de las viviendas poseen letrinas.
- **Medio de transporte:** El medio de transporte principal es la motocicleta. En la zona cuentan con servicio de ómnibus (privado): Paso Barreto - Hugua Po'i - Concepción.
- **Tratamiento de basura:** No se cuenta con servicio de recolección de basura. En mayor porcentaje queman y en menor medida depositan en hoyos.
- **Energía eléctrica:** Proveída por la ANDE. Se cuenta con un transformador por cada 8 o 9 casas.

Jhugua Guazú

Información general

Zona: Rural

Distancia del centro urbano: A unos 36 km de la ciudad de Concepción (Loreto-Paso Barreto)

Municipio del cual depende: Loreto

División del territorio: Jhugua Guazú se divide en 3 zonas

Límites: Estancias Tupa Mba'e, Estancia Buenaventura. Comunidades de Jhugua Poi, Jhugua Rivas La Asunción y Jhugua Bonete

Principales vías de acceso: Ruta Loreto-Paso Barreto, Jhugua Rivas La Asunción, Jhugua Bonete

Habitantes: 1061 personas

Cantidad de familias/viviendas: 603 familias en las zonas de Jhugua Bonete, Jhugua Rivas Boquerón, Islería, Laguna Cristo Rey, Anderi Jhugua Guazu, Jhugua Bonete

Comunidades indígenas: No hay comunidades indígenas en la zona.

Aspectos históricos

Se conformó hace más de 70 años. Durante la época de la revolución del 47 ya había pobladores en la zona; varios de ellos ex combatientes de la Guerra del Chaco. Los apellidos más conocidos son: Obelar y Medina. Entre los primeros pobladores se encuentran el Monseñor Alejo Obelar y Leonardo Obelar.

Entre los aspectos positivos se señalan: Tranquilidad, y el lugar, la tierra es apta para producción; y se destacan además la unidad, solidaridad, la organización y la gente.

Principales actividades económicas

- Agricultura, producción hortícola con sistema de riego para autoconsumo y venta. Por lo general comercializan en la ciudad de Loreto.
- Los varones migran al Chaco para trabajar en las estancias, frigoríficos y tambos (Loma Plata), desde los 15 años.
- Las mujeres migran a las ciudades para trabajar de empleadas domésticas, algunas continúan estudiando; y otras van al exterior en busca de oportunidades laborales.
- De la producción ganadera se comercializa leche, queso.
- Algunos se dedican a la cría de gallinas y venden huevos.

Producción hortícola

Situación del empleo: Escasa oferta laboral en la zona. La gente migra por cuestiones de estudio o trabajo.

Actividades recreativas

- **Fiesta patronal:** Sagrado Corazón de Jesús. Se celebra en junio, dependiendo del calendario religioso. Participan de la celebración las personas de las comunidades cercanas y pobladores del lugar.
- **Hípico:** Carrera de caballo de manera semanal, dependiendo de la época.
- **Torneo de fútbol:** Principalmente participan equipos conformados por hombres. Se están incorporando las mujeres en la categoría de fútbol 5.
- **Otras celebraciones:** Festejo del Día del Niño y del Día de la Juventud en las instituciones educativas de la zona.

Medios de comunicación

- **Radio:** Tekopyahu (Loreto), Regional (Concepción)
- **TV:** por antena
- **Celular:** La mayoría tiene acceso a internet. La principal forma de comunicación es a través de WhatsApp.

Organizaciones / Asociaciones

- Comisión vecinal
- Comité productivo María Auxiliadora
- Comité de agricultores y horticultores
- Comisión de la iglesia
- Clubes deportivos

Principales problemáticas económicas, sociales y culturales

- Falta fuentes de trabajo a nivel local
- Pobreza
- Migración en busca de oportunidades laborales y educativas
- Existen profesionales, pero no pueden ocuparse en su área formativa.
- Abigeato
- Desarraigo
- Aún persisten prácticas machistas orientadas a asignar tareas del hogar a las mujeres y tareas productivas a los hombres.

Aspectos necesarios para un mayor desarrollo

- Fuentes de trabajo y seguridad laboral
- Evitar la migración y el desarraigo
- Mejorar los caminos vecinales
- Asistencia técnica y acompañamiento sostenido a productores locales con miras a la comercialización de productos y la generación de mercados seguros

Acceso a servicios básicos

- **Red de abastecimiento de agua:** Cuentan con red de abastecimiento a través de la Junta de Saneamiento. Además, cuentan con dos pozos instalados para la producción con sistema de riegos. Algunas personas tienen pozos particulares en sus viviendas.
- **Red de desagüe:** No se cuenta con red de desagüe en la comunidad.
- **Pozo-Letrina:** Más del 50% de las viviendas aún cuentan con letrinas y un porcentaje menor baños con pozo ciego.
- **Medio de transporte:** El medio de transporte principal es la motocicleta. Sobre la ruta principal se puede acceder al servicio de ómnibus privados: Paso Barreto a Concepción.
- **Tratamiento de basura:** En algunas viviendas clasifican las basuras, ya que tienen chacras y esta le sirve de abono. Los productos inorgánicos son quemados o arrojados en hoyos.
- **Energía eléctrica:** Proveída por la ANDE.

Islería

Información general

Zona: Rural

Distancia del centro urbano: A unos 44 km de la ciudad de Concepción (Loreto-Paso Barreto)

Municipio del cual depende: Loreto

División del territorio: Islería

Límites: Estancia Santa Teresa, Laguna Cristo Rey, Jhugua Guazú, Río Aquidabán, Estancia Santa Teresa, Naranjaty

Principales vías de acceso: Ruta Loreto-Paso Barreto

Habitantes: Alrededor de 108 personas

Cantidad de familias/viviendas:

Aproximadamente 25 casas; pero no todas están habitadas

Comunidades indígenas: No hay comunidades indígenas en la zona.

Aspectos históricos

La comunidad posee unos 150 años de antigüedad. Su conformación data de principios de la Guerra Grande. En la actualidad existen unas 25 casas; de las cuales algunas no están habitadas.

Los apellidos más antiguos son Zavala, Colman, Miskinich, Cristaldo y Saveiro. Los Martínez migraron de la zona de Puerto Pinasco en el año 1975; y los Saveiro eran oriundos de Ykua Porâ.

Recibe el nombre de Islería por poseer características similares a las de una isla en épocas de lluvia y creciente; ya que las zonas donde se encuentran la Laguna Tajy, el Arroyo Javevy'y y el Río Aquidabán solían desbordarse a menudo; dificultando el acceso y quedando el territorio completamente aislado.

Entre los aspectos positivos se señalan: Tranquilidad, el lugar, la solidaridad entre vecinos, la gente es buena, trabajadora y tiene ganas de superarse.

Principales actividades económicas

- Pequeña ganadería (entre 10 a 15 vacas)
- Pequeñas granjas y chacras para autoconsumo
- Cría de ganado menor
- Trabajo en las estancias del Chaco y algunos casos en las estancias cercanas
- Venta de leche, queso, huevo, gallina, chancho
- Pesca

Situación del empleo: Casi la totalidad realiza alguna actividad por jornal (changas). Se sustentan de la agricultura y la cría de ganado para consumo y venta según necesidad. Un jornal diario equivale a 65 mil guaraníes dependiendo del trabajo que se solicite.

Actividades recreativas

- **Fiesta patronal:** 1 de octubre, Santa Teresita del Niño Jesús, se comparte con la comunidad en el tinglado de la iglesia. Entre las actividades que se realizan durante la festividad se mencionan:
 - **Laceada:** se realiza en el terreno de la iglesia. Doma de toro.
 - **Torneo de fútbol 5:** principalmente entre adultos.
- **Hípico:** Carrera de caballo de manera semanal, dependiendo de la época.
- **Otras actividades:** En la escuela cada año se festeja el Día del Niño con actos culturales y fiesta.

Medios de comunicación

- **Radio:** Tekopyahu (Loreto), Ypané y Regional (Concepción)
- **TV:** por antena principalmente, Telefuturo
- **Celular:** La mayoría tiene acceso a internet. La principal forma de comunicación es a través de WhatsApp. Tienen un grupo conformado por pobladores actuales y también personas que vivieron en la comunidad pero que migraron en busca de mejores oportunidades.

Organizaciones / Asociaciones

- Comisión vecinal
- Comité de mujeres Santa Teresita del Niño Jesús (Tekoporâ)
- Referentes de base de la capilla
- Comisión de agua

Principales problemáticas económicas, sociales y culturales

- Pobreza y desigualdad: asociadas principalmente a las necesidades existentes en la zona
- Falta de fuentes de trabajo en la comunidad
- Abigeato en un porcentaje mínimo, y en casos aislados
- No hay un recambio para la producción, la mayoría son adultos mayores.
- Pocos estudiantes en la escuela debido a que el porcentaje de natalidad en la zona es bajo
- Migración y desarraigo

Aspectos necesarios para un mayor desarrollo

- Mejorar los caminos vecinales

Acceso a servicios básicos

- **Red de abastecimiento de agua:** La comunidad cuenta con un pozo instalado por los pobladores sin asistencia de SENASA.
- **Red de desagüe:** No se cuenta con red de desagüe en la comunidad.
- **Pozo-Letrina:** Del total de viviendas, 15 familias cuentan letrinas y las 10 restantes tienen instalados baños con pozo ciego.
- **Medio de transporte:** El medio de transporte principal es la motocicleta. En la zona cuentan con servicio de ómnibus (privado): Paso Barreto - Concepción (TTL).
- **Tratamiento de basura:** No se cuenta con servicio de recolección de basura. En mayor porcentaje queman los residuos.
- **Energía eléctrica:** Proveída por la ANDE desde el año 2000 aproximadamente.

Información general

Zona: Rural

Distancia del centro urbano: A unos 48,9 km de la ciudad de Concepción (Loreto-Paso Barreto)

Municipio del cual depende: Loreto

División del territorio: Laguna Cristo Rey

Límites: Anderí, Estancia Cristo Rey, Estancia Reino, Estancia Buena Vista y la Ruta de Loreto- Paso Barreto, Estancia Buena Vista

Principales vías de acceso: Ruta Loreto-

Paso Barreto, Anderí-Potrero Tacuara - Calle 12-Horqueta (inhabilitada)

Habitantes: 224 personas

Cantidad de familias/viviendas: Más de 50 familias

Comunidades indígenas: No hay comunidades indígenas en la zona.

Aspectos históricos

Empezó a poblar antes del año 1870, posee unos 150 años de antigüedad. Se denomina Cristo Rey en honor al Santo Patrono de la comunidad y Laguna debido a que existe un arroyo en la zona.

La construcción de la iglesia se realizó en el año 1920 y está ubicada frente a la Escuela N° 1723 Andrés T. Morel Cristaldo.

Entre los primeros pobladores se encuentran los de apellido Morel, Giménez, Cristaldo y Salomón; estos últimos provenientes de Italia y Francia. Actualmente existen unas 50 casas a lo largo del territorio.

Entre los aspectos positivos se señalan: el lugar, la naturaleza, la tranquilidad y el hecho de ser una zona segura.

Principales actividades económicas

- Predomina la ganadería en pequeña escala.
- Se realizan actividades de granja y cría de ganado menor.
- La agricultura es preferentemente para autoconsumo; la chacra y la huerta familiar son tareas asumidas por las mujeres.
- Por lo general los hombres trabajan en las estancias del Chaco como empleados, otros en las estancias de la zona y algunos son macateros.
- En la zona también están los que se desempeñan como empleados públicos en las instituciones educativas.
- Los pobladores de la comunidad se dedican a la venta de queso, leche, huevo y animales menores. Existen compradores que se abastecen de la comunidad para luego comercializar los productos en las ferias.
- Existen además personas que tienen pequeños comercios tales como: despensas, comedor, venta de minicarga y carbón.

Comedor

Situación del empleo: No hay fuentes de trabajo en la zona; hay mucha gente que se ve obligada a salir de la comunidad en busca de oportunidades de empleo. La mayoría se sustenta a través de trabajos esporádicos y puntuales (changas); por consiguiente, no tienen ingresos seguros. También hay profesionales que no pueden emplearse en su área de estudio debido a la falta de oportunidades.

Actividades recreativas

- **Fiesta patronal:** Cristo Rey, se celebra el tercer domingo de noviembre. Se organiza laceada mecánica (moto), participan alrededor de 50 a 60 caballos y jinetes. La recaudación es para la iglesia.
- **Deporte:** Se realizan torneos de fútbol.
- **Otras actividades:** En la escuela se organizan festivales, se celebra el Día del Niño y el Día de la Juventud.

Medios de comunicación

- **Radio:** Paso Barreto, Loreto y Arroyito
- **TV:** Por antena, sin eso no hay señal
- **Celular:** La mayoría tiene acceso a internet. La principal forma de comunicación es a través de WhatsApp.

Organizaciones / Asociaciones

- Comisión vecinal
- Comité de iglesia
- Comisión de agua

Principales problemáticas económicas, sociales y culturales

- Pobreza
- Falta fuentes de trabajo en la comunidad
- Falta apoyo a la producción campesina, asistencia técnica, capacitación, fortalecimiento y generar canales de comercialización.
- Poca presencia del Estado
- Falta oportunidades para las mujeres y jóvenes (capacitación, iniciativas productivas).
- Migración de jóvenes en busca de oportunidades laborales y educativas
- Desarraigamiento

Aspectos necesarios para un mayor desarrollo

- Mayor presencia del Estado
- Generar fuentes de trabajo
- Apoyo a la agricultura familiar campesina (capacitación, acompañamiento y asistencia técnica sostenida para la producción del campo)
- Instalar una unidad de salud en la zona
- Tener acceso al almuerzo escolar

Acceso a servicios básicos

- **Agua potable:** Pozo instalado por la Secretaría de Emergencia Nacional en el 2010. Es autogestiva, no se gestionó con SENASA y abastece a toda la comunidad.
- **Red de desagüe:** No se cuenta con red de desagüe en la comunidad.
- **Pozo-Letrina:** Baño con pozo ciego en un 70 %.
- **Medio de transporte:** El medio de transporte principal es la motocicleta. Anteriormente ingresaba la empresa de transporte Amanecer, pero el dueño de la misma falleció y dejó de funcionar. En la ruta cuentan con servicio de ómnibus (privado): Paso Barreto-Concepción (Empresa TTL).
- **Tratamiento de basura:** No se cuenta con servicio de recolección de basura. En mayor porcentaje queman y una población menor deposita en hoyos.
- **Energía eléctrica:** Proveída por la ANDE.

Instituciones y sitios de interés

Anderi

Información general

Zona: Rural

Distancia del centro urbano: A unos 63 km de la ciudad de Concepción (Loreto-Paso Barreto)

Municipio del cual depende: Loreto

División del territorio: Anderi

Límites: Estancia Cristo Rey, Estancia Isla Guazú, Potrero Tacuara, Laguna Cristo Rey

Principales vías de acceso: Laguna Cristo Rey, Ruta Loreto-Paso Barreto, Potrero Tacuara (callejón que está inhabilitado)

Habitantes: 94 personas aprox

Cantidad de familias/viviendas: Entre 20 a 24 viviendas

Comunidades indígenas: No hay comunidades indígenas en la zona

Aspectos históricos

El nombre de Anderi se vincula a la historia de un joven secretario que murió de sed durante la época de sequía mientras visitaba los campos menos poblados de la zona. Hay una cruz que lleva el nombre de Manuel Anderi para recordarlo.

Los inicios de la comunidad se remontan a los años 1920.

Existen tres grandes familias en la zona: Alcaraz, Ocampos y Giménez. Los primeros pobladores provenían principalmente de las comunidades de Domínguez Nigó y Jhugua Ocampos.

Para acceder al territorio se atraviesa un puente de madera construido por los lugareños; que a su vez es utilizado para conectar con la localidad de Laguna Cristo Rey, y tener salida a la ruta que une Loreto con Paso Barreto.

Las casas están construidas en las zonas altas; por lo que hay muy pocas viviendas visibles desde el camino. Esto se debe a que en épocas de lluvia es recurrente el desborde del arroyo; por lo que se altera la dinámica de entrada y salida del lugar ya que se inundan los caminos y la comunidad queda aislada.

Entre los aspectos positivos se señalan: la tranquilidad, la tierra es apta para la producción, la solidaridad y el buen relacionamiento entre los pobladores, el arraigo por parte de los pobladores.

Principales actividades económicas

- Pequeña ganadería y cría de animales menores para consumo y venta según necesidad
- Los productos de la chacra y huerta son principalmente para consumo.
- Hay personas que se dedican a la elaboración de queso para venta. Hay compradores que llegan hasta la zona para abastecerse y luego volver a vender en la ciudad de Concepción.
- Elaboración y venta de sombreros de Karanda'y
- Se menciona además que en la zona hay un pequeño almacén con productos básicos de consumo familiar y una carpintería.
- Por lo general se dedican a realizar actividades por jornal (changas); y algunos van a trabajar a la ciudad de Concepción.

Situación del empleo: Es una zona que se sustenta de la producción del campo para autoconsumo principalmente, un alto porcentaje realiza trabajos por jornal (changas). No hay empleos fijos, la escuela es la única institución pública de la zona que funciona bajo la peculiaridad de poseer un sistema unidocente.

Actividades recreativas

- **Fiesta patronal:** Virgen del Rosario, se celebra el 6 de octubre. Se realizan festivales, doma de toro mecánico, rezo, karu guasu, recorrido del santo, bingo, torneo de fútbol, entre otras actividades.
- **En las escuelas:** Se festeja el Día del Niño.

Medios de comunicación

- **Radio:** Concepción y Aquidabán de Paso Barreto, Radio Cristal de Arroyito
- **TV:** SNT (canal de aire), el resto por antena
- **Celular:** La mayoría tiene acceso a internet. La principal forma de comunicación es a través de WhatsApp, pero tienen problemas de cobertura en la zona.

Organizaciones / Asociaciones

- Comisión vecinal
- Comisión de festejo para la celebración de la fiesta patronal (es puntual para la actividad)
- Asociación de Cooperadora Escolar (ACE)

Principales problemáticas económicas, sociales y culturales

- Pobreza y desigualdad: asociada principalmente a las necesidades existentes en la zona
- Faltan fuentes de trabajo en la comunidad.
- Caminos en mal estado
- Falta apoyo a la producción campesina, asistencia técnica, capacitación, fortalecimiento y canales para la comercialización de productos; sobre todo en época de creciente.
- Crisis económica, que se agudizó con la pandemia (escaso y nulo movimiento económico)
- Pérdida de producción en época de creciente, que no es asistida por parte del gobierno local.
- Escasa presencia del Estado en la zona
- Desborde del arroyo

Aspectos necesarios para un mayor desarrollo

- Mejorar los caminos vecinales
- Construcción de una Unidad de Salud en la zona
- Acceso a una red de abastecimiento de agua comunitaria
- Asistencia técnica sostenida para la producción familiar campesina

Acceso a servicios básicos

- **Agua potable:** En la comunidad tienen pozos o tajamares en sus terrenos. Durante la sequía hay problemas de abastecimiento de agua.
- **Red de desagüe:** No se cuenta con red de desagüe en la comunidad.
- **Pozo-Letrina:** La mayoría de los hogares tiene letrina.
- **Medio de transporte:** El medio de transporte principal es la motocicleta. No cuentan con servicio de ómnibus.
- **Tratamiento de basura:** No se cuenta con servicio de recolección de basura. En mayor porcentaje queman.
- **Energía eléctrica:** Proveída por la ANDE, desde hace aproximadamente 10 años.

Paso Barreto

Información general

Zona: Rural

Distancia del centro urbano: A unos 58 km de la ciudad de Concepción (Loreto-Paso Barreto)

Municipio del cual depende: Paso Barreto

División del territorio: Inmaculada Concepción, María Auxiliadora, San Salvador, Santo Domingo, 6 de Agosto, Nuevo Barrio y un sector denominado Ex Carbonería

Límites: Al Norte con Estancia Prosperidad, al sur con Isla Tuyu, al oeste con el río Aquidabán – Loreto y al este: Estancia Rancho Z

Principales vías de acceso: Ruta Loreto. Paso Barreto, Calle 15, Cruce x, San Alfredo, Jhugua Ñandu-P. Mbutu – Horqueta

Habitantes: 1100 personas aprox.

Cantidad de familias/viviendas: 862 familias

Comunidades indígenas: Existen 3 comunidades indígenas situadas en la zona Norte del Distrito, una de ellas linda con el departamento de Amambay. Son de la etnia Mbya Guaraní y Pa'i Tavytera.

Son unas 123 familias: Jeguahaty (55 familias), Tacuarendyju (13) y Vy'a Renda (45).

Aspectos históricos

La ciudad de Paso Barreto empezó a poblararse en el año 1800. Durante la época de la Guerra Grande pasaron las tropas del Mariscal López. Cuentan que cerca del río Aquidabán vivía un hombre de apellido Barreto, en una zona de paso donde los habitantes referenciaban como "el paso de don Barreto", de esta denominación proviene el origen de su nombre.

Con la creación del Ministerio de Obras Públicas, durante el periodo del General Samaniego, la zona empezó a crecer y desarrollarse a nivel de infraestructura. Todas las instituciones que se crearon se iniciaron en su época. El 26 de agosto de 1970 se realizó la apertura oficial de la escuela que lleva su nombre y queda aproximadamente a unos 500 metros del río Aquidabán.

Los apellidos más conocidos de la zona son: Sánchez, Franco, López, Blanco. Los Luschich eran emigrantes de Checoslovaquia que vinieron después de la Guerra del Chaco. También algunos excombatientes se quedaron a poblar el territorio.

Durante la época de auge de los aserraderos muchas personas provenientes principalmente de Curuguaty empezaron a asentarse en el lugar. En la actualidad algunos provienen de las localidades de Concepción, Pedro Juan Caballero y Coronel Oviedo, principalmente para trabajar por temporadas.

La distritación de Paso Barreto es reciente, la misma se realizó el 31 de mayo de 2013 y es una fecha emblemática para los pobladores de la zona.

Entre los aspectos positivos se señalan: Tranquilidad, seguridad, no hay delincuencia, la unidad entre la gente. el ambiente y el bajo nivel de contaminación. Además, se menciona que el río y la playa son atractivos turísticos durante las épocas de elevada temperatura.

Principales actividades económicas

- Agricultura, huerta y horticultura principalmente para consumo; una sola familia se dedica a la venta.
- Ganadería en pequeña y gran escala (estancias)
- Trabajo en las estancias cercanas (empleados fijos)
- Aserraderos (piso de parquet, incienso). Desde 1994 empezaron a funcionar los primeros aserraderos, después fue mermando debido a la falta de materia prima.
- Pesca para venta y autoconsumo
- Algunos se dedican la producción y venta de carbón.
- Las mujeres se dedican a la venta de comida, peluquería, confección de ropa con el apoyo del SNPP.
- Comercio: despensa, copetín, servicio de minicarga, entre otros
- Funcionarios públicos: algunos se emplean como docentes en escuelas y colegios; otros trabajan en la USF, la Municipalidad u otras instituciones del Estado.
- Migración con fines laborales a las ciudades de Concepción, Asunción, y también a países como España
- Venta ambulante de frutas y verduras
- Hay pequeños talleres de moto y automóviles donde la gente también se emplea.

 **Situación del empleo:** Hay mucho desempleo en la zona. Durante la pandemia, se registra un aumento de la venta de comida rápida y más elaboradas; también se incrementaron las huertas familiares (al menos una por vivienda).

Hay algunas personas que se encontraban empleadas en otras ciudades como Ciudad del Este, y tuvieron que regresar debido al contexto Covid-19.

En la ciudad funcionan aserraderos (compradores de Filadelfia, exportación de piso parquet e incienso). Se menciona que la producción disminuyó por falta de materia prima.

En la zona son mayoritariamente jornaleros, muchos de ellos jóvenes que se dedican a realizar changas ("por diaseros") limpian casas, acarrean arena, abono, y trabajan el aserradero.

Escasos empleos para las mujeres: algunas son funcionarias del Estado, en su mayoría ama de casa y por lo general migran a otras ciudades.

Actividades recreativas

- **Fiesta Patronal:** El 8 de agosto se celebra el día de Santo Domingo.
- **Deportes:** Torneo de fútbol de mujeres y hombres (hay una escuela de fútbol). Además, se inició la liga de varones y mujeres; la principal es la liga juvenil. Se practica también vóley y piki vóley.
- **Hípico:** Carrera de caballo. Laceada, el club de lazo eso es lo que más atrae gente de otros lugares.
- **Festival Municipal** de Paso Barreto del río Aquidabán
- **Fiestas bailables:** Los fines de semana, organizadas por las comisiones de la comunidad.
- **Desfile:** El principal se realiza en junio por la Paz del Chaco y el aniversario de distritación; ya que se juntan ambos eventos en una celebración.
- **En las instituciones educativas:** Se organizan torneos interescolares e intercolegiales o intercurso e interdistritales desde la ACE o el EGIE.
- **Turismo:** Playa en el río Aquidabán. Suelen ir personas a pescar o pasar el día.
- **Actividades de la USF:** Club de embarazadas y de madres, octubre rosa. Con pacientes diabéticos se realizan charlas y actividades lúdicas.

Medios de comunicación

- **Radio comunitaria:** Aquidabán Comunicaciones y Santa Cecilia, Lira FM, Radio Regional (Concepción)
- **TV:** por antena principalmente (Claro, Tigo y Personal)
- **Celular:** La mayoría tiene acceso a internet. La principal forma de comunicación es a través de WhatsApp. Facebook: página de actividades de la Municipalidad.

Principales problemáticas económicas, sociales y culturales

- Pobreza
- Faltan fuentes de trabajo en la comunidad, principalmente para jóvenes y mujeres.
- Migración en busca de oportunidades laborales y educativas (Asunción y Concepción)
- Desarraigamiento
- Contaminación debido a la utilización de hornos para carbón
- Conflictos cuando hay presencia de personas que no son del lugar
- Falta educación sexual debido al aumento de embarazos adolescentes.
- Inundación
- Falta oferta educativa terciaria (universidades).
- Machismo por cuestiones culturales y religiosas

Aspectos necesarios para un mayor desarrollo

- Fuentes de trabajo y remuneración justa
- Generación de oferta educativa universitaria
- Apoyo a la producción campesina, asistencia técnica sostenida, mercado seguro, comercialización a precios justos de venta
- Trabajo articulado entre partidos políticos de cara al desarrollo del municipio
- Mejorar los caminos vecinales
- Instalación de industria de lácteos
- Invertir en recuperación del caudal del río

Acceso a servicios básicos

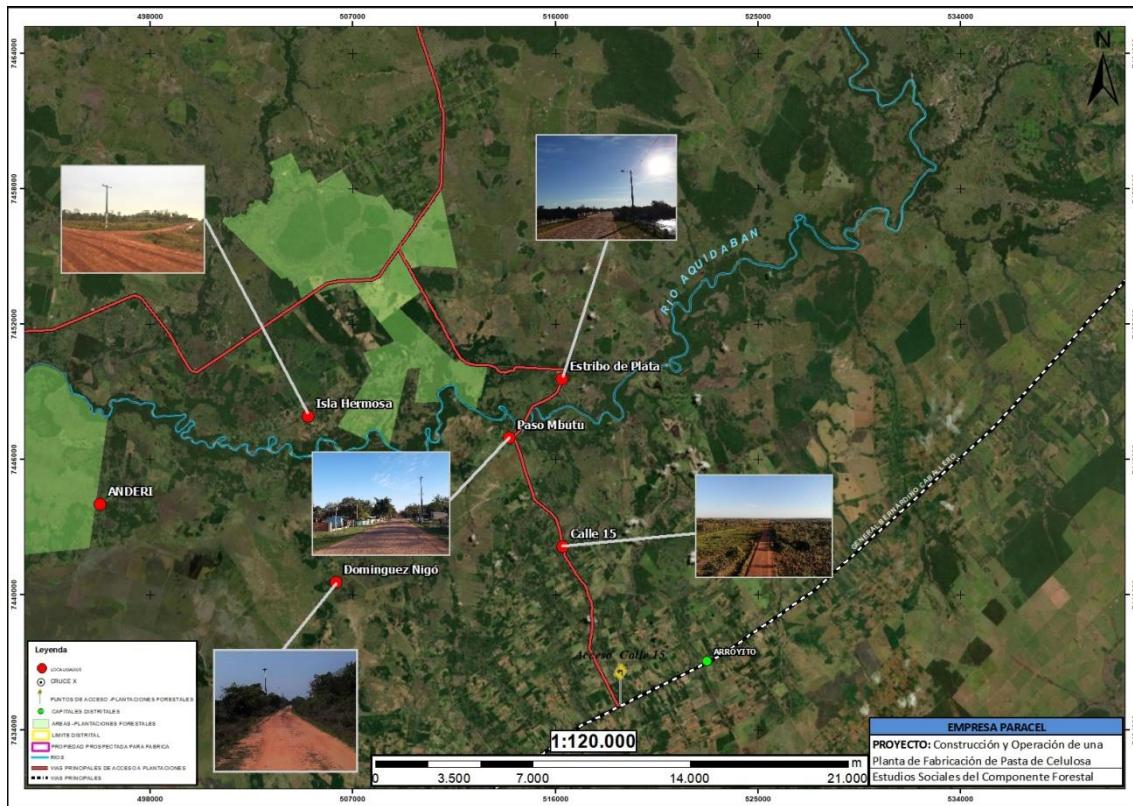

- **Red de abastecimiento de agua:** Cuentan con red de agua potable, se organizan a través de juntas de saneamiento.
- **Red de desagüe:** Cuenta con desagüe pluvial y alcantarillado sanitario en algunos lugares de la zona urbana.
- **Pozo-Letrina:** La mayoría de los hogares en la zona urbana de Paso Barreto tienen baños con pozo ciego y cámara séptica debido al terreno.
- **Medio de transporte:** El medio de transporte principal es la motocicleta. En la zona cuentan con servicio de ómnibus (privado). Empresa TTL-Paso Barreto. Paso Barreto hasta concepción día de por medio. Jhugua Ñandú-Horqueta.
- **Tratamiento de basura:** No se cuenta con servicio de recolección de basura. En mayor porcentaje queman y una población menor deposita en hoyos. En el predio de la Municipalidad queman una vez por semana en un horno.
- **Energía eléctrica:** Proveída por la ANDE.

Mapa Acceso Calle 15 (Zona Sur)

El acceso conocido como Calle 15, se encuentra en el límite del distrito de Horqueta y Arroyito. Este trayecto conecta con las comunidades de: Calle 15, Domínguez Nigó, Isla Hermosa, Paso Mbutu y Eistro de Plata.

Calle 15 (Norte)

Información general

Zona: Rural

Distancia del centro urbano: A unos 78 km de la ciudad de Concepción (Ruta V-Calle 15)

Municipio del cual depende: Horqueta

División del territorio: Calle 15 Zona Norte

Límites: Calle 14, Paso Mbutu, Arroyito, Ruta V- Calle 15 Sur

Principales vías de acceso: Ruta V, Calle 14, Paso Mbutu

Habitantes: 241 personas

Cantidad de familias/viviendas: Alrededor de 51 familias

Comunidades indígenas: No hay comunidades indígenas en la zona.

Aspectos históricos

La escuela de la comunidad se fundó en 1960; pero alrededor de 1900 ya empezó a habitarse la zona. Se la conoce como calle 15 debido a que desde el municipio de Horqueta cada dos mil metros hay callejones que están enumerados.

Calle 15 Norte, está más próxima a la localidad de Paso Mbutu; y Calle 15 Sur se encuentra del otro lado de la ruta V.

A su vez, el callejón (camino) divide a la comunidad de Horqueta y Arroyito desde la distritación de este último en el año 2016.

Además, se menciona que entre los primeros pobladores se encuentran los de apellido Alarcón, Benítez y Pereira.

Entre los aspectos positivos se señalan: que los pobladores se conocen, son solidarios; y la comunidad es tranquila.

Principales actividades económicas

- Ganadería en pequeña escala principalmente
- Agricultura para consumo; los rubros de renta son el sésamo, la sandía, la piña y el feijao.
- Pequeños comercios: despensa, lugares de venta de combustible
- Algunos funcionarios, docentes y mayormente jubilados del sector

Situación del empleo: Los jóvenes migran al terminar el colegio a ciudades como Pedro Juan Caballero o Asunción. Esto se debe principalmente a la falta de empleos en la zona.

Actividades recreativas

- **Fiesta patronal:** Divino Niño, se celebra el 20 de julio. Se realiza una misa, procesión y un gran almuerzo en la comunidad.
- **Deportes:** Torneos de futbol, vóley, carrera de 100 m llano (en calle 15 Sur)
- **Otras celebraciones:** La ACE se encarga de organizar torneos para recaudar fondos. Se celebra el Día del Niño.

Medios de comunicación

- **Radio:** Comunitaria 102.5 y Radio Cristal (Arroyito), Los Ángeles (Horqueta)
- **TV:** SNT y Telefuturo por antena
- **Celular:** La mayoría tiene acceso a internet. La principal forma de comunicación es a través de WhatsApp. No hay buena señal en la zona.

Organizaciones / Asociaciones

- Comisión de iglesia
- Comisión de Deporte (carrera)
- Asociación de Cooperadora Escolar (ACE)

Principales problemáticas económicas, sociales y culturales

- Faltan fuentes de trabajo en la comunidad.
- Escasa presencia del Estado en la zona
- Migración, en su mayoría jóvenes
- No se cuenta con red de abastecimiento de agua potable. El agua es salada.

Aspectos necesarios para un mayor desarrollo

- Apoyo y presencia del Estado en la comunidad
- Instalar un sistema de abastecimiento de agua potable en la zona

Acceso a servicios básicos

- **Agua potable:** En la comunidad no dispone de agua potable para consumo. En las viviendas cuentan con pozos particulares o tajamares para el uso diario.
- **Red de desagüe:** No se cuenta con red de desagüe en la comunidad.
- **Pozo-Letrina:** Aproximadamente el 70% de los hogares aún cuentan con letrina, el 30 % restante con pozo ciego.
- **Medio de transporte:** El medio de transporte principal es la motocicleta. En la zona cuentan con servicio de ómnibus (privado): Jhugua Ñandu - Concepción, Puentesiño - Concepción (día de por medio).
- **Tratamiento de basura:** No se cuenta con servicio de recolección de basura. En mayor porcentaje queman.
- **Energía eléctrica:** Proveída por la ANDE, desde 1990 aproximadamente.

Zona: Rural

Distancia del centro urbano: A unos 77 km de la ciudad de Concepción (Ruta V)

Municipio del cual depende: Horqueta

División del territorio: Domínguez Nigó

Límites: Isla Hermosa, Paso Senda, Potrero Tacuara

Principales vías de acceso: Loreto-Anderi, Potrero Tacuara, desde Isla Hermosa (en canoa). Desde Paso Mbutu por calle 12. Desde Horqueta por Callejón 40, calle 10, 11 y 12

Habitantes: No mencionan

Cantidad de familias/viviendas: Alrededor de 36 familias

Comunidades indígenas: No hay comunidades indígenas en la zona.

Aspectos históricos

La comunidad tiene aproximadamente 25 años de antigüedad. Las casas distan entre 2 a 3 km unas de otras.

Entre los primeros pobladores están los de apellido Zabala, Giménez y Fernández.

Entre los aspectos positivos se señalan: la gente, el hecho de que todos se conocen y la tranquilidad.

Principales actividades económicas

- Elaboración de sombreros de Karanda'y para venta a las despensas de la comunidad o a un "patrón" que comercializa en otras zonas
- Pocos trabajan en las estancias como encargados.
- Están los que trabajan por jornal y se dedican a hacer alambrado o limpieza de terreno en las estancias; pero no se da de manera frecuente.
- Agricultura para consumo; producción de mandioca, maní, caña de azúcar
- Ganadería en pequeña escala
- Cría de ganado menor
- Producción de leche, huevo, queso. Con algunos productos permutan por artículos en las despensas.
- Pequeños comercios; despensa y comercial

Vivienda

Actividades recreativas

- **Fiesta patronal:** El 24 de junio, día de San Juan, se comparte con la comunidad y se realizan comidas tradicionales como el so'o hu'u.
- **Club Hípico:** Carrera de caballo cada 15 días
- **Torneo de fútbol:** En las comunidades de Potrero Tacuara, Anderi, Calle 12, isla Tuyu, Cuartelero
- **Actividad de Pesca:** En el río Aquidabán

Medios de comunicación

- **Radio:** Récord de Arroyito y Radio Regional de Concepción
- **TV:** por antena principalmente.
- **Celular:** no cuentan con cobertura.

Organizaciones / Asociaciones

- Comisión de deporte

Principales problemáticas económicas, sociales y culturales

- Faltan fuentes de trabajo.
- Falta mercado seguro para comercialización de productos artesanales.
- Falta mejorar los caminos vecinales.
- Abigeato

Aspectos necesarios para un mayor desarrollo

- Mejorar los caminos vecinales
- Instalar un sistema de abastecimiento de agua potable en la zona

Acceso a servicios básicos

- **Agua potable:** Cuentan con pozo artesiano desde hace cinco meses. Se gestionó a través de la Gobernación. El agua es tratada con cloro.
- **Red de desagüe:** No se cuenta con red de desagüe en la comunidad.
- **Pozo-Letrina:** La mayoría de las viviendas aún tiene letrina en las viviendas. Aproximadamente siete viviendas con pozo ciego.
- **Medio de transporte:** El medio de transporte principal es la motocicleta. En la zona no cuentan con ómnibus, tienen que salir hasta calle 12 para disponer del servicio.
- **Tratamiento de basura:** No se cuenta con servicio de recolección de basura. En mayor porcentaje depositan en hoyos.
- **Energía eléctrica:** Proveída por la ANDE, desde 1999.

Distancia del centro urbano: A unos 80 km de la ciudad de Concepción (Loreto- Paso Barreto)

Municipio del cual depende: Paso Barreto

División del territorio: La Palma, San Pedro, San Miguel y Barrio Centro

Límites: Jhugua Ñandú, Ruta Paso Barreto- Loreto, Paso Mbutu, Domínguez Nigó, río Aquidabán

Principales vías de acceso: Ruta Paso Barreto- Loreto, Cruce Calle 14 - Cruce Calle 15, Paso Mbutu -Jhugua Ñandú, Dominguez Nigó

Habitantes: 700 personas

Cantidad de familias/viviendas: Alrededor de 160 viviendas

Comunidades indígenas: No hay comunidades indígenas en la zona.

Aspectos históricos

Isla Tuyu, como era conocida anteriormente tiene alrededor de 170 años.

Empezó a poblararse en el año 1850. Los primeros pobladores eran de apellido; Giménez, Silva, Núñez, De León, Escobar, Báez, Vargas.

La escuela se construyó en 1913 y el primer profesor era de apellido Silva.

Entre los aspectos positivos se señalan: la gente, es una comunidad unida, se destaca la tranquilidad, la naturaleza, y la seguridad de la zona.

Principales actividades económicas

- Pequeña ganadería para consumo; en algunos casos producen queso y venden.
- En menor medida trabajan en la chacra, ya que la tierra no es apta para cultivo.
- Los hombres trabajan en las estancias del Chaco a la edad de 12 o 13 años.
- Las jóvenes migran a Asunción, Concepción, Pedro Juan; España o Argentina.
- Alrededor de 80 familias se dedican a la elaboración y venta de sombreros de Karanda'y.
- Algunos trabajan en el frigorífico, y por lo general son jornaleros ("pordiasero").
- Otros son funcionarios públicos en las instituciones de la zona (salud, educación).

Elaboración de sombrero de Karanda'y

Comité Brazos Unidos del sombrero de Karanda'y

Situación del empleo: Existen muy pocas fuentes de trabajo en la comunidad y un alto porcentaje de desempleo. La situación se complejiza teniendo en cuenta que varias personas regresan del Chaco debido a que la oferta de trabajo disminuyó durante la pandemia. La gran mayoría trabaja por jornal haciendo changas y una gran cantidad de personas migra a otras ciudades y ya no regresa.

En la comunidad se dedican principalmente a la agricultura y ganadería en pequeña escala para autoconsumo. Mencionan que las personas que se emplean en el frigorífico ganan más, pero las condiciones laborales no son óptimas, se habla de un sistema de explotación debido a la carga horaria alta y la falta de estabilidad laboral.

Actividades recreativas

- **Fiesta patronal:** San Pedro, el 29 de junio y San Miguel el 29 de septiembre. Para la celebración se organiza desfile, lotería y fiesta.
- **Club Hípico:** Se realiza carrera de caballo.
- **Deporte:** Torneos de fútbol "femenino y masculino". Los hombres participan de competencias que se organizan en Paso Mbutu, Jhugua Ñandu, Horqueta y Paso Barreto. También se realizan torneos de vóley.
- **Desde la USF:** Se organiza caminatas y participan de la actividad los adultos mayores y los niños.
- **En las escuelas:** Se celebra el Día del Niño, día de la juventud, torneo interescolar e interclase.

Medios de comunicación

- **Radio:** Cristal FM 95.6 (Arroyito)
- **TV:** por antena principalmente.
- **Celular:** Se cuenta, pero la señal de internet en la zona no es buena.

Organizaciones / Asociaciones

- Comisión vecinal
- Comisión de Iglesia (2)
- Asociación de Cooperación Escolar
- Comité de Mujeres Brazos Unidos del Sombrero de Karanda'y (dejaron de activar durante la pandemia)
- Grupo juvenil de la iglesia

Principales problemáticas económicas, sociales y culturales

- Faltan fuentes de trabajo.
- Pobreza
- Falta de oportunidades, especialmente para los jóvenes
- Migración y desarraigo
- Deficiencia en la educación impartida en las escuelas
- Disminución de la población joven

Aspectos necesarios para un mayor desarrollo

- Brindar educación de calidad.
- Apoyo a la producción campesina, asistencia técnica sostenida y estrategias de comercialización.
- Fuentes de trabajo, especialmente para los jóvenes.
- Mejorar la infraestructura, equipamiento de salud.
- Una antena repetidora de internet.

Acceso a servicios básicos

- **Agua potable:** Cuentan con red de abastecimiento de agua gestionada a través de SENASA; desde hace 10 años.
- **Red de desagüe:** No se cuenta con red de desagüe en la comunidad.
- **Pozo-Letrina:** El 2% de las viviendas posee baño con pozo ciego, los demás cuentan con letrina.
- **Medio de transporte:** El medio de transporte principal es la motocicleta. En la zona cuentan con servicio de ómnibus (privado) desde la ruta Loreto-Paso Barreto: Paso Barreto – Concepción, y Puentesiño - Concepción.
- **Tratamiento de basura:** No se cuenta con servicio de recolección de basura. En mayor porcentaje queman y una población menor deposita en hoyos.
- **Energía eléctrica:** Proveída por la ANDE desde hace 13 años. La instalación es muy precaria, hay muchos cortes de energía eléctrica. Para mantenimiento de sistema vienen funcionarios de Paso Barreto o Jhugua Ñandu.

Información general

Zona: Rural

Distancia del centro urbano: A unos 84 km de la ciudad de Concepción (Ruta V- Calle 15)

Municipio del cual depende: Horqueta

División del territorio: Paso Mbutu

Límites: Arroyito, Col. Jorge Sebastián Miranda, Estribo de Plata, Domínguez Nigó, Paso Senda, Calle 15-Horqueta, Calle 15- Arroyito

Principales vías de acceso: Calle 15, Calle

14, Jhugua Ñandu, Paso Barreto y Puentesiño

Habitantes: 500, aproximadamente

Cantidad de familias/viviendas: Alrededor de 120 familias

Comunidades indígenas: No hay comunidades indígenas en la zona.

Aspectos históricos

Cuentan que Paso Mbutu es más antigua que la ciudad de Horqueta; pero no hay escrituras que lo demuestren. Mencionan que desde la época de los López empezó a poblarse el lugar.

En los inicios sólo existían tres casas que servían de depósito de yerba mate, de Tropa 40; de ahí se trasladaba el cargamento hasta Concepción. El nombre se vincula a dos aspectos: Mbutu por el insecto; y, porque era un lugar de "paso" para transportar yerba mate, de Pedro Juan Caballero a Concepción, con tropas que se trasladaban en carretas.

Entre los primeros pobladores se encuentran: los Soria, Pianderi, Peña y Regunega.

Entre los aspectos positivos se señalan: la tranquilidad, las costumbres y tradiciones, el río, la plaza y la naturaleza. Se menciona además que es una comunidad bastante unida y solidaria.

Principales actividades económicas

- Agricultura principalmente para consumo (mandioca, poroto, maíz). Alrededor de unas 20 familias tienen huertas.
- Algunos se dedican a la producción de banana; y otros producen pastizales para los ganaderos de la zona.
- Ganadería en pequeña y gran escala
- Hay personas que se dedican a la venta de leche.
- Producción de sombrero de Karanda'y y tarrafa. Hay compradores que llegan a la comunidad y luego venden en otras zonas.
- Funcionarios de instituciones públicas existentes en la zona (USF, escuela, registro civil y policía)
- Pesca para consumo y venta
- Actividades de caza para consumo
- Trabajo por jornal en las estancias cercanas y del Chaco: hacen limpieza de terreno, alambrado, fabricación de postes. Acuerdan una cantidad de hectáreas para trabajar. Son en su mayoría varones los que se dedican y también familias.
- Las mujeres se dedican a la venta ambulante de comidas dulces y saladas, hacen limpieza y lavan ropa.
- También hay pequeños comercios como: despensas, comedores, puesto de venta de combustible y taller mecánico.

Taller mecánico

Situación del empleo: Hay mucho desempleo. La mayoría realiza changas por jornal. Los adolescentes empiezan a trabajar al terminar el 9no grado. Como consecuencia del desempleo hay migración al Chaco, a Pedro Juan Caballero o Asunción; y en algunos casos a España o Argentina.

Actividades recreativas

- **Fiesta patronal:** El santo Patrono es San José, se celebra el 1 de mayo. Además, se realizan otras celebraciones como: el día de María Auxiliadora, el 24 de mayo; Santa Rosa, el 30 de agosto. Deportes: laceada, carrera de caballo, vóley, torneos de fútbol.
- **Otras Actividades:** Playa, pesca y fiestas en el río Aquidabán; principalmente en la época de Navidad o Año Nuevo donde se reúnen personas de las localidades de Horqueta, Arroyito, Jhugua Ñandu.
- **En la escuela** se celebra además el día del niño y de la juventud y el día del Folclore.
- **Desde la USF:** Se realizan club de hipertensos y diabéticos, madres PANI y adultos mayores.

Medios de comunicación

- **Radio:** Cristal 96.5 y radio comunitaria 102.5 (Arroyito), Guyra Campana (Horqueta), Regional (Concepción)
- **TV:** Telefuturo, SNT, y por antena
- **Celular:** La principal forma de comunicación es a través de WhatsApp, pero en la zona no hay buena señal.

Organizaciones / Asociaciones

- Comisión vecinal
- Comisión de Pescadores de Paso Mbutu (en formación)
- Asociación de Cooperadora Escolar (ACE)
- Consejo de Salud
- Comisión de Agua
- Comisión de iglesia laicos
- Liga de fútbol Sport Paso Mbutu
- Escuela de fútbol

Principales problemáticas económicas, sociales y culturales

- Pobreza
- Faltan fuentes de trabajo en la comunidad.
- Trabajos esporádicos y precarizados
- Migración y desarraigo
- Problemas de abastecimiento de agua potable (la misma es salada)
- Faltan universidades públicas en la zona.
- Inundación

Aspectos necesarios para un mayor desarrollo

- Red de abastecimiento de agua potable para la comunidad
- Fuentes de trabajo
- Centros de formación (Universidad Pública, mandos medios)
- Invertir y desarrollar el turismo. Infraestructura para potenciar la playa. Un parador comunitario para vender los productos
- Mejorar los caminos vecinales
- Formación y fortalecimiento de comité productivos locales
- Apoyo a los productores de la zona por parte del gobierno local

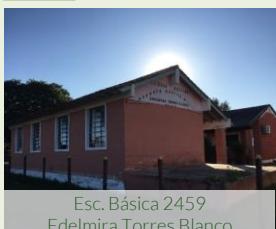

Acceso a servicios básicos

- **Agua potable:** La comunidad no dispone de un sistema de red de agua potable. Utilizan pozo para uso cotidiano y para beber se abastecen de la naciente a la que denominan Yvu o Chorro. También utilizan agua de lluvia.
- **Red de desagüe:** No se cuenta con red de desagüe en la comunidad.
- **Pozo-Letrina:** La mayoría de los hogares tienen letrinas, y en menor porcentaje pozo ciego.
- **Medio de transporte:** El medio de transporte principal es la motocicleta. En la zona cuentan con servicio de ómnibus (privado): Jhugua Ñandu-Concepción, y Puentesiño- Concepción (día de por medio).
- **Tratamiento de basura:** No se cuenta con servicio de recolección de basura. En mayor porcentaje queman.
- **Energía eléctrica:** Proveída por la ANDE.

Estrobo de Plata

Información general

Zona: Rural

Distancia del centro urbano: A unos 88 km de la ciudad de (Ruta V- Calle 15)

Municipio del cual depende: Paso Barreto

División del territorio: Estrobo de Plata

Límites: Paso Mbutu, Colonia Jorge, Sebastián Miranda, Estancia La Blanca

Principales vías de acceso: Calle 15 - Paso Mbutu, Colonia Jorge Sebastián Miranda

Habitantes: 50 personas

Cantidad de familias/viviendas: Alrededor de 17 viviendas

Comunidades indígenas: No hay comunidades indígenas en la zona.

Aspectos históricos

La comunidad empezó a poblar antes de 1904; tiene al menos unos 100 años de antigüedad. Cuentan que el nombre se debe a que durante el periodo de los López se utilizaban estribos de plata para montar a caballo. Los primeros pobladores eran de apellido Pereira.

Antes había en la comunidad unas 33 viviendas; pero muchos migraron a la Colonia Jorge Sebastián Miranda.

Entre los aspectos positivos se señalan: la tranquilidad, la libertad, la naturaleza, la tierra y el río.

Principales actividades económicas

- Se dedican a la ganadería principalmente, para autoconsumo y venta según necesidad cada 15 o 22 días.
- Agricultura; producen principalmente mandioca, ya que la tierra no es apta para cultivar.
- Cría y venta de ganado menor (gallina principalmente)
- En algunos hogares se produce queso para la venta.
- Los varones van a trabajar al Chaco y las mujeres principalmente a España o Argentina.

Situación del empleo: No hay fuentes de trabajo en la comunidad, la gente migra en busca de mayores oportunidades. El rubro principal es la ganadería para consumo.

Producción ganadera

Actividades recreativas

- **Fiesta patronal:** El 8 de diciembre, día de la Virgen de Caacupé, se celebra con una misa, un festival y un "karu guasu" para compartir entre los pobladores de la comunidad.
- **Hípico:** Se organizan carreras de caballo.

Medios de comunicación

- **Radio:** Cristal FM-Aroyito
- **TV:** Telefuturo, SNT, y por antena
- **Celular:** La mayoría tiene acceso a internet. La principal forma de comunicación es a través de WhatsApp.

Organizaciones / Asociaciones

- Comisión vecinal

Principales problemáticas económicas, sociales y culturales

- Falta de fuentes de trabajo en la comunidad
- Inseguridad, asaltos
- Falta apoyo a la producción campesina, asistencia técnica, capacitación, fortalecimiento y canales de comercialización a precios justos.
- Abigeato

Aspectos necesarios para un mayor desarrollo

- Tener un rubro de exportación como el tártago
- Mercado seguro y precios justos de venta
- Apoyo del gobierno y asistencia técnica sostenida para la producción campesina

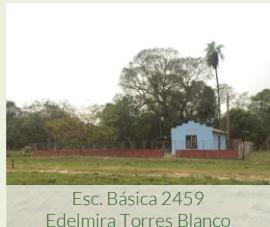

Acceso a servicios básicos

- **Agua potable:** La comunidad no cuenta con sistema de abastecimiento de agua potable. La mayoría de los hogares posee pozos; 2 de las viviendas de la zona no cuentan con pozo y se abastecen de los vecinos más próximos.
- **Red de desagüe:** No se cuenta con red de desagüe en la comunidad.
- **Pozo-Letrina:** La mayoría de las viviendas tienen letrinas, solo 5 cuentan con baños con pozo ciego en la comunidad.
- **Medio de transporte:** El medio de transporte principal es la motocicleta y caballo. En la zona cuentan con servicio de ómnibus (privado) tres veces por semana. (Horarios: para ir a Concepción a las 5:15 AM, para regresar sobre la Ruta V Pasa a las 15:00 PM): Puentesiño - Concepción, y Jhugua Ñandu - Concepción.
- **Tratamiento de basura:** No se cuenta con servicio de recolección de basura. En mayor porcentaje queman y tiran en hoyos.
- **Energía eléctrica:** Proveída por la ANDE. Hay una vivienda sin conexión eléctrica. Hay cortes frecuentes de energía eléctrica en la zona.

Mapa Acceso Calle 15 (Zona Norte)

En dirección al Norte, siguiendo el acceso de Calle 15, se encuentran las comunidades de Colonia Jorge Sebastián Miranda, Sargento José Félix López y Ayala Cue.

Para llegar a la comunidad de Ayala Cue por esta vía, se debe ingresar unos 20 km en dirección al distrito de Bella Vista Norte por un camino de servidumbre de paso localizado al margen derecho de la ruta, en el distrito de Sargento José Félix López.

Jorge Sebastián Miranda

Información general

Zona: Rural

Distancia del centro urbano: A unos 101, 85 km de la ciudad de Concepción (Loreto-Paso Barreto)

Municipio del cual depende: Paso Barreto

División del territorio: Cerrito, San Antonio, San Juan, San Isidro, San

Sebastián, Alegría y Las Mercedes y La Esperanza (en proceso de aprobación)

Límites: Estancia Trementina - Puentesiño, Paso Barreto

Principales vías de acceso: Calle 15 - Paso

Mbutu, Puentesiño, Paso Barreto

Habitantes: 1300 personas, aprox.

Cantidad de familias/viviendas: No mencionan

Comunidades indígenas:

Jeguahaty: situada en la estancia Aguerito (55 familias aproximadamente)

Vy'arenda Boquerón: camino a Puentesiño (45 familias aproximadamente)

Aspectos históricos

No mencionan con exactitud el año de origen de la comunidad, cuentan que desde antes de 1950 ya había pobladores en la zona. Lleva el nombre de Jorge Sebastián Miranda en homenaje a un profesor horqueteño que falleció. Pero la comunidad es más conocida como Jhugua Ñandu; el nombre se debe a que anteriormente había una zona de estancias conocida como Jhugua donde había muchos avestruces.

Entre los aspectos positivos se señalan: la tierra, la tranquilidad, la gente es trabajadora con deseos de estudiar y superarse.

Principales actividades económicas

- Aproximadamente el 15% se dedica a la producción agrícola. Se cultiva sésamo, mandioca y maíz para consumo. El sésamo y el zapallo son rubros de renta. Actualmente hay más producción hortícola; principalmente tomate, sandía y banana.
- La mayoría se dedica a la ganadería en pequeña escala. Se produce leche y queso para consumo y también para venta.
- Algunos hombres trabajan en las estancias del Chaco, por jornal o por trato (subcontratados), o con sueldo fijo. En algunos casos van a las estancias acompañados de sus esposas para trabajar; éstas son encargadas de las cocinas. Otros son "jornaleros" en las estancias cercanas.
- Un gran porcentaje trabaja por jornal diario (changas) en rubros como la construcción (albañilería).
- Las mujeres en su mayoría son amas de casas o poseen pequeños negocios como despensa, decoración, alquiler de sillas. Las que son estudiantes siguen formándose y trabajando en las ciudades.
- Algunos son funcionarios públicos (salud, educación).

Situación del empleo: Se estima que el porcentaje de desempleo es del 30%. La mayoría trabaja haciendo changas. No muchos se dedican a la agricultura debido a la falta de caminos y la dificultad para trasladar la producción; los que se dedican al rubro comercializan a través de intermediarios en la zona. La población joven se traslada a las ciudades para emplearse/ estudiar; pero muchos dejan sus estudios para trabajar y ayudar a sus familias.

Taller mecánico

Actividades recreativas

- **Fiesta patronal:** Se organiza por barrio y se involucra toda la comunidad. Se mencionan: San Sebastián, el 20 de enero; San Juan Bautista, el 24 de junio; Las Mercedes, el 24 de septiembre.
- **Deportes:** Torneo de fútbol y vóley (mujeres y hombres)
- **Laceada:** Se organizan torneos; pero oficialmente una vez al año a través de la asociación.
- **Otras celebraciones:** En el mes de agosto se celebra la independencia del área educativa (anteriormente el área educativa dependía de la ciudad de Loreto).
- **Los colegios y las escuelas** realizan festivales y campeonatos interescolares, celebran el Día del Niño y el Día de la Juventud.

Medios de comunicación

- **Radio:** Cristal (Arroyito), Regional (Concepción)
- **TV:** Por antena. Por canal de aire SNT, Telefuturo y Canal 13
- **Celular:** La mayoría tiene acceso a internet. La principal forma de comunicación es a través de WhatsApp. Durante la pandemia se activó un grupo para informes con los pobladores y referentes de instituciones.

Organizaciones / Asociaciones

- Asociación de vecinos
- Comisión vecinal: Barrios Alegría y San Isidro
- Comité de producción agrícola (2)
- Comisión de Iglesia (Las Mercedes y San Juan)
- Tienen grupo juvenil para organizar la fiesta patronal
- Asociación de Cooperadoras Escolares

Principales problemáticas económicas, sociales y culturales

- Pobreza
- Faltan fuentes de trabajo en la comunidad.
- Falta apoyo a la producción campesina, asistencia técnica sostenida.
- Mercado seguro para la producción y canales para comercialización a precios justos de venta
- Deserción escolar asociada a la necesidad de emplearse a temprana edad

Aspectos necesarios para un mayor desarrollo

- Capacitación y asistencia técnica sostenida a productores
- Apoyo a la producción campesina; mercado seguro para comercialización a precios justos de venta
- Aumentar el stock de insumos y medicamentos de la USF
- Instalar universidades públicas en la zona

Acceso a servicios básicos

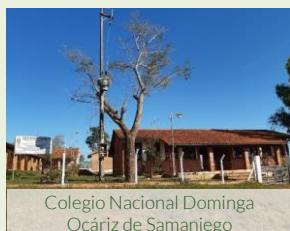

- **Agua potable:** La comunidad cuenta con 5 tanques. Algunos instalados a través de SENASA y otros vía gobernación. El mantenimiento es responsabilidad de la comisión de agua. Hay una comunidad que se abastece del río Aquidabán, pozo común o arroyos cercanos.
- **Red de desagüe:** No se cuenta con red de desagüe en la comunidad.
- **Pozo-Letrina:** El 45 % de las viviendas tiene baño con pozo ciego. La mayoría posee letrinas en sus hogares.
- **Medio de transporte:** El medio de transporte principal es la motocicleta. En la zona cuentan con servicio de ómnibus (privado): Puentesiño - Concepción, y Jhugua Ñandu - Concepción.
- **Tratamiento de basura:** No se cuenta con servicio de recolección de basura. Los residuos se queman y se tiran en el hoyo.
- **Energía eléctrica:** Proveída por la ANDE. Aproximadamente desde el año 1999 se cuenta con energía eléctrica en la zona. Hay una comunidad indígena que no tiene luz eléctrica.

Información general

Zona: Rural

Distancia del centro urbano: A unos 180 km de la ciudad de Concepción (Ruta V- Calle 15)

Municipio del cual depende: Loreto

División del territorio: San Clemente, Santa Ana, Piri Poty, La Suerte, Yvype, Loma Pytâ, Unión

Límites: San Carlos del Apa, Bella Vista Norte, Col. Jorge Sebastián Miranda. Alrededor de la zona urbana hay asentamientos y estancias

Principales vías de acceso: Calle 15, Bella Vista, Paso Barreto - Jhugua Ñandu, San Carlos del Apa

Habitantes: 2887 personas

Cantidad de familias/viviendas: Alrededor de 861 familias

Comunidades indígenas:

Takuarita: cuenta con 189 habitantes, aproximadamente; viven de la agricultura, la caza y la pesca.

La Esc. Básica N° 6292 Takuarita posee alrededor de 96 estudiantes.

Reciben asistencia médica por parte de la USF de Sargento José Félix López una vez al mes.

Aspectos históricos

Los pobladores mencionan que después de la Guerra del 70 empezó a conformarse la comunidad. Fue tierra de excombatientes de la Guerra Grande.

Puentesiño, es la capital del distrito. Algunos mencionan que su nombre se vincula al hecho de que antiguamente había brasileros que se dedicaban a la macatería; uno de ellos falleció bajo un puente y por ende empezaron a denominar a la zona como "Puentesiño".

José Félix López, en honor al hijo de Juanita Pesoa y el Mariscal López que combatió y murió en la Guerra Guasu.

Entre los apellidos más antiguos se señalan: Antebi, Ojeda, Sánchez, Pereira. La comunidad se conformó con pobladores provenientes principalmente de Horqueta, Tacuati y Brasil.

Entre los aspectos positivos se señalan: la tranquilidad, la naturaleza y los recursos naturales (hay bosques nativos, tierra fértil, el río y el Arroyo Amambay que corre en sentido contrario al río Apa), no hay contaminación en la zona, las personas producen para satisfacer sus necesidades de consumo, hay solidaridad y se conocen entre los miembros de la comunidad.

Principales actividades económicas

- Agricultura. Cultivo de maíz y sésamo para venta; el maíz tupi pytâ se vende a una estancia de la zona para alimento de animales; también hay huertas y chacra para consumo (maní, zapallo, mandioca, batata).
- Producción ganadera en pequeña y gran escala
- Cría de ganado menor.
- Pesca para consumo y venta
- En las estancias están quienes trabajan como jornaleros o como encargados "peones".
- Explotación de madera: Tajy, Yvyra Pytâ, Urundeymi y Moreysyvo.
- Empleados del Estado (docentes, salud y otras instituciones públicas de la zona)
- Pocas mujeres son empleadas domésticas, mayormente son amas de casa y no reciben remuneración; algunas trabajan en las estancias.
- Hay personas que se dedican a la venta de minutas. En la zona también producen carbón.
- Hay comercios tales como: despensa, comercial, taller de motocicletas y automóviles, copetín, comedores, carpintería, ferretería, auto repuestos y aserraderos. También cuentan con servicio de hospedaje, peluquería, servicio de minicarga y reparación de celulares.

Situación del empleo: Se menciona el desempleo, la falta de fuentes de trabajo en la zona que garanticen la estabilidad, seguridad laboral y remuneración acorde a los trabajos que se realizan.

Muchos migran al terminar el bachillerato o antes para trabajar. Van a las ciudades de Concepción Pedro Juan Caballero.

Un gran porcentaje se dedica a realizar trabajos esporádicos a cambio de un jornal diario que varía dependiendo de la actividad que se les solicite.

Actividades recreativas

- **Fiesta patronal:** El día de San Pedro y San Pablo se celebra el 29 de junio.
- **Deportes:** Organizan torneo de piquí vóley y fútbol. Tienen liga de fútbol (liga senior y liga femenina).
- **Carrera de caballos:** En el hípico local se organizan eventos a los cuales acuden pobladores de otras localidades.
- **Aniversario de distritación:** Se celebra el 7 de septiembre; se realizan festivales, novenarios, elección de miss, jineteada, serenata y desfile estudiantil durante la semana de aniversario.
- **En las escuelas** se organizan olimpiadas educativas interescolares. Además, se realiza el festival de la carreta, del Karai Octubre y del trébol.
- **Festival Paso Bravo:** en la fecha se realizan desfiles estudiantiles y participan referentes artísticos de Arroyito, Belén, San Carlos del Apa.
- **Festival del Arroyo Itaky,** se celebra el 7 de septiembre.
- **Actividades que se realizan desde la USF:** Se organizan charlas dirigidas a la población de adultos mayores, club de embarazadas, club de padres, entre otros.

Medios de comunicación

- **Radio:** Itaky FM 98.8, Radio Activa, Radio Más 98.5, Radio Evangélica Pregonero FM 96.5, y Sendero Luz del Cielo
- **TV:** Por antena. Por canal de aire SNT, Telefuturo y Canal 13
- **Celular:** La mayoría tiene acceso a internet. La principal forma de comunicación es a través de WhatsApp.

Organizaciones / Asociaciones

- Comisiones vecinales
- Comité de iglesias –Grupos Juveniles
- Comisión de deportes
- Asociación de Cooperadoras Escolares (ACE)
- Equipo de Gestión de Instituciones Educativas (EGIE)
- Comité 29 de Junio Jaiko Poravé Rekávo
- Asociación Campesina Norte Pyahu
- Asociación de Comerciantes

Principales problemáticas económicas, sociales y culturales

- Faltan fuentes de trabajo en la comunidad; principalmente para jóvenes.
- Trabajo informal precarizado
- Falta apoyo a la producción campesina, asistencia técnica, capacitación, fortalecimiento y generación de canales de comercialización adecuados.
- Falta infraestructura de salud acorde a las necesidades de la zona.
- Falta mejorar los caminos.
- Existen problemas de abastecimiento de agua en los asentamientos
- Se registra un aumento de casos de trabajo sexual.
- Embarazo precoz
- Se registran casos de adolescentes en situación de consumo de drogas.
- Migración y desarraigo
- Faltan centros y universidades que garanticen la formación terciaria.

Aspectos necesarios para un mayor desarrollo

- Acceder a capacitaciones y oportunidades laborales
- Fortalecer la agricultura familiar campesina y los canales de comercialización de productos
- Mejorar los caminos existentes a fin de comercializar en otras zonas
- Construcción de parques y plazas
- USF ampliada, con infraestructura adecuada para atención

Acceso a servicios básicos

- **Agua potable:** La comunidad posee al menos 10 Juntas de Saneamiento. Además, cuentan pozos de agua y tajamares particulares. Hay comunidades que tienen problemas de abastecimiento de agua.
- **Red de desagüe:** No se cuenta con red de desagüe en la comunidad.
- **Pozo-Letrina:** 93 Viviendas aún cuentan con letrinas; las demás poseen pozo ciego con cámara séptica. En los asentamientos predominan las viviendas con letrinas.
- **Medio de transporte:** El medio de transporte principal es la motocicleta. En la zona cuentan con servicio de ómnibus (privado). Empresa Yerutí y Estrella del Norte provenientes de Pedro Juan, una empresa de Bella Vista, empresa Águila de Concepción.
- **Tratamiento de basura:** No se cuenta con servicio de recolección de basura. Los residuos por lo general se queman o se tiran en hoyos. Hay un terreno baldío en el barrio Loma Pytâ sirve como vertedero de la zona; donde la gente que tiene medios deposita su basura.
- **Energía eléctrica:** Proveída por la ANDE.

Instituciones y sitios de interés

Ayala Cue

Información general

Zona: Rural

Distancia del centro urbano: A unos 172 km de la ciudad de Concepción (Ruta V-Calle 15)

Municipio del cual depende: Bella Vista Norte

División del territorio: Ayala Cue

Límites: Casualidad, Estancia Santa Teresa, Estancia Zapallo, Estancia Errante

Principales vías de acceso: Cruce Bella Vista, Puentesiño por camino de estancias

Habitantes: No menciona

Cantidad de familias/viviendas: Alrededor de 130 familias

Comunidades indígenas: No hay comunidades indígenas en la zona.

Aspectos históricos

Desde 1950 ya había población asentada en Ayala Cue; pero se desconoce la fecha en que empezó a conformarse la comunidad.

Los primeros pobladores eran de apellido Ayala; después vinieron los Mendoza. Como inicialmente fue tierra exclusiva de los Ayala, en la actualidad, se la conoce como Ayala Cue ya que los terrenos pasaron a ser también propiedad de otras familias.

Los primeros pobladores de la zona fueron los de apellido Ayala y Mendoza.

Entre los aspectos positivos se señalan: tranquilidad, la unidad, la no discriminación, el diálogo. Se menciona además que la Estancia aporta a la comunidad en materia de salud.

Principales actividades económicas

- Se dedican a la agricultura para consumo (poroto, maíz, mandioca). La mayoría tiene chacra y huerta.
- Las mujeres son amas de casa y algunas migran a Concepción, Bella Vista Norte y Pedro Juan Caballero para trabajar y estudiar; y otras venden comestibles en la zona.
- Algunos varones trabajan en la estancia Santa Teresa como encargados “peones”; los jóvenes trabajan en los retiros.
- Existen pequeñas despensas en la comunidad.
- Unas cinco personas son funcionarios del Estado y trabajan en las escuelas de la zona.

Fuente: <https://m.facebook.com/Escuela-Basica-3990-Santa-Teresa-994509710629099/photos/1017546474992089/>

Situación del empleo: Hay desempleo en la zona, por lo general realizan changas esporádicas y reciben un pago entre quince y veinte mil guaraníes.

Actividades recreativas

- **Fiesta patronal:** El 15 de octubre se conmemora el día de Santa Teresita, se celebra con misa, procesión, números artísticos y una gran comida que se comparte en la Estancia Santa Teresa.
- **Deportes:** Torneo de futbol y vóley
- **Actividades organizadas en las escuelas:** Se celebra el Día del Niño y el Día de la Juventud, la fiesta de San Juan. Se organiza bingo y torneos de futbol con los estudiantes y se comparte con los padres y los demás miembros de la comunidad.

Medios de comunicación

- Radio cristiana
- **TV:** Telefuturo por antena
- **Celular:** no hay buena señal en la zona.

Organizaciones / Asociaciones

- Asociación de Cooperadora Escolar (ACE)

Principales problemáticas económicas, sociales y culturales

- Pobreza y desigualdad
- Faltan fuentes de trabajo en la comunidad.
- Trabajos esporádicos y precarizados
- Falta una unidad de salud familiar para atención médica.
- Falta un puesto policial en la zona.

Aspectos necesarios para un mayor desarrollo

- Acceder a capacitaciones y oportunidades laborales
- En materia de seguridad es necesaria la instalación de un puesto policial en la comunidad.
- Se requiere la instalación de una USF en la zona.

Acceso a servicios básicos

- **Agua potable:** La comunidad cuenta con un pozo que abastece a la comunidad. Se gestionó a través de la gobernación de Amambay.
- **Red de desagüe:** No se cuenta con red de desagüe en la comunidad.
- **Pozo-Letrina:** La mayoría de las viviendas tienen letrinas.
- **Medio de transporte:** El medio de transporte principal es la motocicleta. En la zona cuentan con servicio de ómnibus (privado): Empresa Yerutí que va a Puentesiño.
- **Tratamiento de basura:** No se cuenta con servicio de recolección de basura, se quema y/o tiran en hoyos.
- **Energía eléctrica:** Proveída por la ANDE, desde hace unos 10 años aproximadamente.

ANEXO 5: INVENTARIO DE PROGRAMAS Y PROYECTOS AID-PARACEL

Inventario de Programas y proyectos en el AID.

A continuación, se presenta la gama de programas y proyectos identificados durante el proceso de elaboración de los estudios sociales. Estos divididos en tres grupos.

- Programas y proyectos identificados durante:
 - La elaboración de la caracterización socioeconómica de las zonas de influencia del proyecto.
 - La identificación de impactos acumulativos y
 - El relevamiento de la percepción de actores institucionales y referentes comunitarios.

Se tomaron en cuenta los registros de la etapa anterior; componente industrial, si bien se presentan programas y proyectos que tienen estrecha relación con los distritos incluidos en el AID del componente forestal, se consideró importante actualizar (donde fue posible) las informaciones respecto a dichas iniciativas.

1- Proyectos identificados durante la elaboración de la caracterización socio-económica de las zonas de influencia del proyecto.

Nro.	Proyecto/Programa	Institución	Descripción resumida	Alcance geográfico	Fechas de ejecución	Situación

10	PRONAFOPE - Programa de Fomento de la Producción Pecuaria.	Ministerio de Agricultura y Ganadería	A través de aportes económicos y capacitación técnica busca promover el incremento de la producción y productividad de los productores familiares pecuarios, contribuyendo a la seguridad alimentaria y la generación de ingresos de los productores/as y sus familias.	Nacional	2009/s/d	En ejecución ²
	Proyecto “Mejorando la seguridad alimentaria y generando oportunidades económicas en el departamento de Concepción”	OCRC (Organización Campesina Regional de Concepción)	Se trabaja la agricultura sostenible, seguridad alimentaria y gestión de recursos ambientales. A través de este se brinda asistencia técnica a pequeños agricultores orgánicos y capacitación laboral y de liderazgo a jóvenes y mujeres, ayudando a mejorar la seguridad alimentaria y el potencial de generación de ingresos.	Departamento de concepción	2018-2021	En ejecución
11	PROMAFI - Proyecto de Mejoramiento de la Agricultura Familiar Campesina e Indígena en el Noreste del Paraguay	Ministerio de Agricultura y Ganadería	El objetivo del proyecto es incrementar de manera sostenible los ingresos de los hogares rurales pobres mediante el fortalecimiento organizacional, la mejora de la producción y el crédito procedente de instituciones financieras intermediarias.	Región Oriental del Paraguay.	2018 - s/d	En ejecución
12	RESIPROAF - Restauración de los Sistemas de Producción de la Agricultura Familiar a Nivel Nacional.	Ministerio de Agricultura y Ganadería	Tiene como objetivo dotar al productor agropecuario y sus familias de apoyos financieros, herramientas tecnológicas, infraestructura y servicios asociados, sirviendo de soporte para otros beneficios ya brindados por el MAG, logrando que los actuales sistemas de producción sean más óptimos, competitivos y modernos.	Nacional	2019 - s/d	En ejecución

Nro.	Proyecto/Programa	Institución	Descripción resumida	Alcance geográfico	Fechas de ejecución	Situación
14	Programa de Modernización y Mecanización de la Agricultura Familiar.	MAG-STP- ITAIPU- UNOPS	El proyecto tiene como objetivo promover el fortalecimiento de emprendimientos de producción agrícola orientados a la integración a los mercados, a cadenas de valores regionales, a través de servicios e insumos para consolidar la modernización tecnológica, el aumento de la productividad, la mejora de los ingresos de las familias en situación de pobreza y extrema pobreza en los asentamientos rurales promoviendo el fortalecimiento organizacional de familias agricultoras.	Concepción, San Pedro, Cañideyú, Caaguazú, Caazapá, y Alto Paraná.	2015 - s/d	En ejecución
15	Tekoporã - Programa de Transferencias Monetarias con Corresponsabilidad.	Ministerio de Desarrollo Social	TEKOPORÃ es un programa de transferencias condicionadas (PTC) que busca brindar protección social a hogares en situación de pobreza y mejorar la calidad de vida de sus participantes. Desde un comienzo el foco fue la facilitación del ejercicio de los derechos a alimentación, salud y educación. En la actualidad, se busca incorporar a personas con discapacidad severa en situación de pobreza y/o vulnerabilidad, así como también a comunidades indígenas.	Nacional	2005 - Indefinido	En ejecución
16	Programa Tenonderã	Ministerio de Desarrollo Social	Busca que las familias que van a egresar de Tekoporã puedan generar sus propios ingresos, sean estables económica y socialmente con alternativas de producción, a fin de que puedan salir y mantenerse fuera de la situación de pobreza. Este programa complementa el trabajo con las familias para una salida estructural y sostenida de su situación de pobreza.	Nacional	2014 - Indefinido	En ejecución

Nro.	Proyecto/Programa	Institución	Descripción resumida	Alcance geográfico	Fechas de ejecución	Situación
17	Programa de pensión alimentaria para adultos mayores en situación de pobreza.	Ministerio de Hacienda	Programa de pensión alimentaria consiste en la otorga a todas las personas mayores de 65 años que viven en situación de pobreza un ingreso económico mensual para satisfacer sus necesidades básicas. Asimismo, también considera a los veteranos de la guerra del Chaco y sus herederos como beneficiarios, también a las familias de los militares y policías caídos en servicio activo.	Nacional	2009 - Indefinido	En ejecución
18	PAI - Programa Ampliado de Inmunizaciones.	Ministerio de Salud Pública y Bienestar Social	Tiene como objetivo la protección adecuada de la población contra enfermedades inmunoprevenibles, para lo cual se garantiza la adquisición y provisión gratuita y efectiva de las vacunas que forman parte del esquema regular de vacunación y de aquellas recomendadas por la OPS/OMS.	Nacional	2004 - Indefinido	En ejecución
19	PANI - Programa Alimentario Nutricional Integral.	Ministerio de Salud Pública y Bienestar Social	El objetivo del Programa es contribuir al mejoramiento de la calidad de vida de la población paraguaya. Posee un enfoque preventivo e integral, favoreciendo la recuperación nutricional de poblaciones vulnerables.	Nacional	2005 - Indefinido	En ejecución
20	PAEP - Programa de Alimentación Escolar del Paraguay.	Ministerio del Ministerio de Educación y Ciencias	Busca instalar una nueva cultura de alimentación saludable, con enfoque de derecho, priorizando los productos de la agricultura familiar y la formación en educación alimentaria nutricional de los estudiantes del sistema educativo.	Nacional	2014 - Indefinido	En ejecución
21	Abrazo - Programa Nacional para la Disminución del Trabajo Infantil	Ministerio de la Niñez y la Adolescencia	Programa nacional de transferencia condicionada para la disminución progresiva del trabajo infantil que suma los componentes de: calle, familia, centros y redes de protección.	Concepción, Amambay, Canindeyú, Alto Paraná, Caaguazú, Cordillera,	2005 - Indefinido	En ejecución

ANNEX II
eDNA FINAL REPORT (NATUREMETRICS)

VERTEBRATE METABARCODING RESULTS

Order number:	101890
Company:	PARACEL S.A.
Contact:	Cyro Croce
Project:	Planta de Celulosa
Sample type:	NatureMetrics eDNA disk filter
Date of report:	4 June 2021
Report version:	3
Number of samples:	115

Thank you for sending your samples for analysis by NatureMetrics. Your samples have been **metabarcoded** following our **eDNA survey - Vertebrates** pipeline. **A taxon-by-sample table of your samples is attached to this report (Paracel_101890.client_tables.xlsx: Table 7)**. Care should be taken in interpreting the numbers in terms of relative species abundance, but a high sequence proportion can be interpreted as lending greater confidence to a detection.

Here we present an overview of the key results, followed by a more detailed report that starts with the taxonomic composition of the samples followed by a more detailed look at the steps taken to extract, amplify, sequence, and analyse your DNA. A glossary for terms in **bold** is provided at the end of the report to define key terms used within the report.

Please note results are summarised by Property in the body of this report. Full results by sample can be found in the attached tables (**Paracel_101890.client_tables.xlsx: Tables 5, 6, 7**). A shapefile summarising the key results is also provided (**Paracel_101890.richness_summary.***). A description of the fields included in the shapefile can be found in the attached table (**Paracel_101890.client_tables.xlsx: Tables 8**).

OVERVIEW OF YOUR RESULTS

- A total of 357 **taxa** were detected
- Average taxonomic **richness** was 39.9 and ranged from 4 to 90
- Most abundant **sequences**: *Pimelodella* sp.
- Most commonly detected **species**: *Hoplias* sp.
- 8 species categorised on the **IUCN Red List** were detected: 5 **Near Threatened** and 3 **Vulnerable**.

FULL REPORT

Sample composition

A total of 357 taxa were detected (**101890.client_tables.xlsx**). 39.5% (141 taxa) were at least 99% similar to a species in the global **reference databases**, and **species** names are suggested for these taxa. The remaining taxa were identified to the lowest possible taxonomic level: 40% to **genus** (143 taxa), 9.8% to **family** (35 taxa), and the remainder to **order** (38 taxa). The taxa belong to 5 **classes**, 38 orders, 90 families, and 188 genera. The taxon count per class was: 195 fish, 30 amphibians, 78 birds, 50 mammals, and 4 reptiles. Note that taxa are approximately equivalent to species but some over- and under-estimation of diversity in some lineages is possible.

Species of note included eight species categorised on the IUCN Red List: turquoise-fronted Amazon (NT, *Amazona aestiva*), greater rhea (NT, *Rhea americana*), Neotropical otter (NT, *Lontra longicaudis*), Chacoan naked-tailed armadillo (NT, *Cabassous chacoensis*), and black-and-gold howler monkey (NT, *Alouatta caraya*), White-lipped peccary (VU, *Tayassu pecari*), South American tapir (VU, *Tapirus terrestris*), and Giant anteater (VU, *Myrmecophaga tridactyla*) (**Table 1**). These were generally limited to a small number of samples, except the Neotropical otter, South American tapir, and Giant Anteater which were found in 11, 10, and 8 of 14 Properties respectively. The number of threatened species detections per sample varied from 0 (51 samples) to 5 (1 sample; **Figure 1**).

The average species richness was 39.9 and ranged from 4 (HE-HU09) to 90 (CR-AQU07). The relative proportion of the sequences found in each of the Properties is summarised by order in **Figure 2** and taxon diversity per Property is summarised in **Table 3** and **Table 4**. For a summary of sequencing proportion per species and genus per Property see **Figure 3** (attached separately). Results per sample can be found in **101890.client_tables.xlsx (Tables 5, 6, 7)**.

A three-barbeled catfish species (*Pimelodella* sp.), which accounted for 7.34% of the total sequence reads, was among the most abundant in terms of sequences. Among the most commonly detected species were a trahiras fish species (*Hoplias* sp.), a characid fish species (Characidae sp.), and a pike cichlid (*Crenicichla lepidota*), which were detected in 101, 98, and 92 of the samples, respectively.

High-quality vertebrate sequence data were obtained for all eDNA samples. All but one laboratory controls behaved as expected. Results for samples ZA-NEG34, ZA-NEG-35, and ZA-NEG36 should be treated as tentative, see Methods for details.

Table 1. Threatened species detected, their IUCN Red List category, and the number of detections.

Class	Species	Red List	Samples	Properties
Aves	Turquoise-fronted Amazon (<i>Amazona aestiva</i>)	NT	2	2
Aves	Greater Rhea (<i>Rhea americana</i>)	NT	1	1
Mammalia	Neotropical Otter (<i>Lontra longicaudis</i>)	NT	31	11
Mammalia	Chacoan Naked-tailed Armadillo (<i>Cabassous chacoensis</i>)	NT	1	1
Mammalia	Black-and-gold Howler Monkey (<i>Alouatta caraya</i>)	NT	8	5
Mammalia	White-lipped Peccary (<i>Tayassu pecari</i>)	VU	6	4
Mammalia	South American Tapir (<i>Tapirus terrestris</i>)	VU	37	10
Mammalia	Giant Anteater (<i>Myrmecophaga tridactyla</i>)	VU	19	8

Table 4 (attached separately). The frequency of occurrence of all detected families per Property. Numbers correspond to the number of taxa belonging to those families in those Properties.

Table 5 (attached separately). Taxon richness among the samples.

Table 6 (attached separately). The frequency of occurrence of all detected families per sample. Numbers correspond to the number of taxa belonging to those families in those samples.

Table 7 (attached separately). A taxon-by-sample table of the proportion of the sequencing output allocated to each taxon in each sample.

Table 8 (attached separately). A description of the fields included in the attached shapefile (**Paracel_101890.richness_summary.***).

Figure 3 (attached separately). The proportion of the sequencing output allocated to the different species and genera (rows) within each Property (columns). Each bubble represents the proportion of DNA for each species/genus for that Property. The size of the bubble is relative to the number of sequences from all taxa for that Property.

METHODS

Laboratory

DNA from each filter was extracted using a commercial DNA extraction kit with a protocol modified to increase DNA yields. DNA was purified to remove PCR **inhibitors** using a commercial purification kit.

Comment: The average yield was 22.25 ng/µl and ranged from 0.402 ng/µl (ZA-NEG14) to 132 ng/µl (MJ-HU16). Sample RZ-TRM64 had a DNA yield below the limit of quantification but successfully passed all subsequent steps. Analysis of the sequence data indicated a possible contamination event during DNA extraction of one batch of samples. Three samples were potentially affected and results from these should be treated as tentative (ZA-NEG34, ZA-NEG-35, ZA-NEG36). All three samples show very similar composition, possibly resulting from contamination, however they are taken from the same Property and may therefore indicate true similarity between samples.

Purified DNAs were amplified with 8-11 replicate **PCRs** for a hypervariable region of the 12S rRNA gene to target vertebrates as part of the eDNA survey - Vertebrates pipeline.

All PCRs were performed in the presence of both a **negative control** and a **positive control** sample (a mock community with a known composition). Amplification success was determined by **gel electrophoresis**.

Comment: PCR reactions were consistently successful for all samples. Electrophoresis bands were strong and of the expected size and no PCRs required repeating.

PCR replicates were pooled and purified, and sequencing adapters were added. Success was determined by gel electrophoresis.

Comment: All samples were successfully indexed, electrophoresis bands were strong and of the expected size. No repeat reactions were necessary.

Amplicons were purified and checked by gel electrophoresis, these were then quantified using a Qubit high sensitivity kit according to the manufacturer's protocol.

Comment: All amplicons were successfully purified and were of high yield (**Table 9**).

All purified index PCRs were pooled into a final library with equal concentrations. The final library was sequenced using an Illumina MiSeq V3 kit at 10 pM with a 20% PhiX spike in.

Table 9 (attached separately). The volume of water filtered and the resultant concentration of purified DNA and index PCRs.

Data Analysis

Sequence data were processed using a custom **bioinformatics** pipeline for quality filtering, OTU clustering, and taxonomic assignment.

Comment: Both negative and positive controls were as expected. Very few sequences were discarded prior to dereplication, which is indicative of high-quality data with minimal PCR and sequencing errors. A total of 6.1 million high-quality sequences were included in the final dataset.

Taxonomic information was added to each **OTU** by means of sequence similarity searches against the NCBI *nt* **reference database** (GenBank) and PROTAX, a probabilistic method that makes assignments at each taxonomic level (species, genus, family, order). Species-level assignments were automatically retained if supported by unambiguous matches to reference sequences at $\geq 99\%$. In cases where there were equally good matches to multiple species, public records from GBIF were used to assess which were most likely to be present. Multiple potential identifications were reported in cases that could not be resolved in this way. Note that multiple OTUs can be identified as belonging to the same species, which is most likely attributed to PCR or sequencing artefacts but potentially intraspecific genomic variation or cryptic diversity.

The OTU table was then filtered to remove low abundance OTUs from each sample ($<0.025\%$ or <10 reads, whichever is the greater threshold for the sample). Common **contaminant sequences** such as human, domestic animals and livestock were then removed. Results are presented for OTUs identified to order or below. Note that unidentified or misidentified taxa can result from incomplete or incorrect reference databases, and taxa may be missed due to low quality DNA, environmental contaminants, or the dominance of other species in the sample.

Limitations

Methodologies have been chosen based on the state of the art, but these choices inherently introduce specific limitations and biases. The chosen **primers** capture the target group well in our experience, however some lineages will be recovered more efficiently than others as no primers work equally well for all target species, especially where the target group is broad. Some lineages are also prone to over-splitting of species, with multiple taxa recovered where only one is expected. Conversely, other lineages are prone to lumping, where multiple species are represented by a single taxon because they have identical sequences in the amplified region.

Comment: In this project, 8 taxa were recovered in the family Tayassuidae but only 3 extant species are known. 3 of these taxa matched most closely to an extinct species of Tayassuidae, the Flat-headed peccary (*Platygonus compressus*). Identifications for these taxa have been revised to family level. It is possible that the 8 taxa represent significant intraspecific genetic variation within *Pecari tajacu* and *Tayassu pecari* that has not previously been captured in the reference databases. Alternatively several of these taxa may represent nuclear-mitochondrial pseudogenes (NUMTs). These represent cases where mitochondrial genes have been inserted into the nuclear genome. These sequences diverge from the true mitochondrial sequence over time, accumulating differences. Such cases are difficult to identify but are likely to affect some lineages more than others.

Assigning taxonomic identities to the sequences is only possible through their comparison to reference databases, which are incomplete and may include sequences which have been misidentified. It is not possible to identify a species that is not represented in the reference database for the targeted gene region. Equally, many species are represented by a single sequence, meaning that the full genetic diversity of the species is not known. For widespread species with distinct populations this can limit our ability to make a species-level identification.

Where there are conflicting matches, the likelihood of presence in the country is used to discriminate between matches if possible. Where records are poor, this step may incorrectly prioritise species for which there are observations. Where matches are sufficient for species- or genus-level identification but the taxon is not known in the sampled country, the identification is reported as tentative. Where

threatened species are detected, manual steps are taken to evaluate the likelihood of presence in the sampling area and only confident detections are reported.

Comment: Chacoan naked-tailed armadillo (*Cabassous chacoensis*, Near Threatened) was detected in one sample in this project. Although this species is not thought to occur in the sampling area it is present in western-central Paraguay and the identification is secure based on currently available reference sequences. All three species in the genus that occur in Paraguay are represented by one or more references and the match to *Cabassous chacoensis* was at 100% similarity (*Cabassous unicinctus*: 98.1%; *Cabassous tatouay*: 98.1%).

Please note that the abundance of taxa cannot be directly inferred from the proportion of total sequence reads. While the proportion of sequence reads is a consequence of abundance, it is also impacted by biomass, activity, surface area, condition, distance from the physical sample, primer bias, and species-specific variation in the genome.

GLOSSARY

bioinformatics

Refers to a data processing pipeline that takes the raw sequence data from **high-throughput sequencing** (often 20 million sequences or more) and transforms it into usable ecological data. Key steps for **metabarcoding** pipelines include quality filtering, trimming, merging paired ends, removal of sequencing errors such as chimeras, clustering of similar sequences into molecular operational taxonomic units (**OTUs**; each of which approximately represents a species), and matching one sequence from each cluster against a reference database. The output is a species-by-sample table showing how many sequences from each sample were identified as each species.

contaminant sequences

The sensitivity of high-throughput sequencing of eDNA means that contamination is always a concern that needs to be minimised. The sources of contamination are threefold:

Natural Examples of natural contaminants include: frequent visitors to site, faecal discharge from predators, livestock, wastewater, and fishing bait. This type of contamination is typically unavoidable and very difficult to quantify. Sequences of this type are typically flagged and conservatively removed from the sequencing output. Typical contaminant species include cow, pig, dog, cat, sheep, etc.

Sampling Human contamination of sampling equipment can reduce the efficiency of the sequencing. This type of contamination can be minimised by stringent contamination protocols, such as PPE.

Laboratory Residual DNA can contaminate other samples processed at the same time in other labs. At NatureMetrics this is mitigated by a designated eDNA laboratory, strict decontamination procedures, negative controls, and good laboratory practices.

eDNA

Short for ‘environmental DNA’. Refers to DNA deposited in the environment through excretion, shedding, mucous secretions, saliva etc. This can be collected in environmental samples (e.g. water, sediment) and used to identify the organisms that it originated from. eDNA in water is broken down by environmental processes over a period of days to weeks. It can travel some distance from the point at which it was released from the organism, particularly in running water. eDNA is sampled in low concentrations and can be degraded (i.e. broken into short fragments), which limits the analysis options.

gel electrophoresis

The process in which DNA is separated according to size and electrical charge via an electric current, while in a gel. The process

is used to confirm the successful amplification of a specific size fragment of DNA.

high-throughput sequencing

Technology developed in the 2000s that produces millions of sequences in parallel. Enables thousands of different organisms from a mixture of species to be sequenced at once, so community DNA can be sequenced. Various different technologies exist to do this, but the most commonly used platform is Illumina's MiSeq. Also known as Next-Generation Sequencing (NGS) or parallel sequencing.

inhibitors/inhibition

Naturally-occurring chemicals/compounds that cause DNA amplification to fail, potentially resulting in false negative results. Common inhibitors include tannins, humic acids and other organic compounds. Inhibitors can be overcome by either diluting the DNA (and the inhibitors) or by additional cleaning of the DNA, but dilution carries the risk of reducing the DNA concentration below the limits of detection. At NatureMetrics, inhibition is removed using a commercial purification kit.

IUCN Red List

The IUCN (International Union for the Conservation of Nature) is a global union of government and civil organisations that disseminates information to assist conservation. The IUCN Red List of Threatened Species is an inventory of the conservation status of over 100,000 species worldwide. The Red List evaluates data such as population trends, geographic range and the number of mature individuals in order to categorise species based on their extinction risk:

Extinct (EX) - No individual of this species remains alive.

Extinct in the Wild (EW) - Surviving individuals are only found in captivity.

Critically Endangered (CE) - species faces an extremely high risk of extinction in the wild. e.g. Population size estimated at fewer than 50 mature individuals.

Endangered (E) - species faces a very high risk of extinction in the wild. e.g. Population size estimated at fewer than 250 mature individuals.

Vulnerable (V) - species faces a high risk of extinction in the wild. e.g. Population size estimated at fewer than 10,000 mature individuals and declining.

Near Threatened (NT) - species is below the threshold for any of the threatened categories (CE, E, V) but is close to this threshold or is expected to pass it in the near future.

Least Concern (LC) - species is not currently close to qualifying for any of the other categories. This includes widespread and abundant species.

Data Deficient (DD) - There is currently insufficient data available to make an assessment of extinction risk. This is not a threat category - when more data becomes

available the species may be recategorised as threatened.

metabarcoding

Refers to identification of species assemblages from community DNA using barcode genes. PCR is carried out with non-specific primers, followed by high-throughput sequencing and bioinformatics processing. Can identify hundreds of species in each sample, and 100+ different samples can be processed in parallel to reduce sequencing cost.

negative control

Used to determine if PCR reactions are contaminated.

OTU

Short for Operational Taxonomic Unit, which is used to classify a group of closely related individuals. For prokaryotes, these groupings are defined using the DNA sequences and their similarities (97% similar to one another). OTUs are thought of as distinct species and unique labels are used when taxonomic identification cannot be assigned.

PCR

Short for Polymerase chain reaction. A process by which millions of copies of a particular DNA segment are produced through a series of heating and cooling steps. Known as an 'amplification' process. One of the most common processes in molecular biology and a precursor to most sequencing-based analyses.

positive control

Used to determine whether the assay is working correctly.

primers

Short sections of synthesised DNA that bind to either end of the DNA segment to be amplified by PCR. Can be designed to be totally specific to a particular species (so that only that species' DNA will be amplified from a community DNA sample), or to be very general so that a wide range of species' DNA will be amplified. Good design of primers is one of the critical factors in DNA-based monitoring.

reference databases

Over time, the DNA sequences of many species have been compiled into publicly accessible databases by scientists from around the world. These databases serve as a reference against which unknown sequences can be queried to obtain a species identification. The most commonly accessed database is NCBI (National Center for Biotechnology Information), which is maintained by the US National Institute of Health. Anyone can search for DNA sequences at <https://www.ncbi.nlm.nih.gov>.

richness

Refers to the total number of species within a sample.

sequences

A DNA sequence is made up of four nucleotide bases represented by the letters A, T, C & G. The precise order of these letters is used to compare genetic similarity among individuals or species and to identify species using reference databases. In high-throughput sequencing analyses (e.g. metabarcoding), many identical copies of the same sequence are obtained for each species in the sample.

The number of copies obtained per species is known as the number of sequence reads, and this is often - although not always - related to the relative abundance of the species.

taxon (s.) / **taxa** (pl.)

Strictly, a taxonomic group. Here we use the term to describe groups of DNA sequences that are equivalent to species. We do not use the term species because we are unable to assign complete identifications to all of the groups at this time due to gaps in the available reference databases.

taxonomy

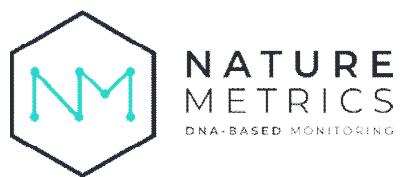

species (s./pl.) - A group of individuals capable of interbreeding. This is the most important taxonomic unit defined by scientists and the population trends of individual species are a key indicator in judging the effect of conservation programs. Related species are grouped together into progressively larger taxonomic units, from genus to kingdom. *Homo sapiens* (human) is an example of a species.

genus (s.) / **genera** (pl.) - A group of closely related species. Each genus can include one or more species. *Homo* is an example of a genus.

family (s.) / **families** (pl.) - A group of closely related genera. *Homo sapiens* is in the family Hominidae (great apes).

order (s.) / **orders** (pl.) - A group of closely related families. *Homo sapiens* is in the order Primates.

class (s.) / **classes** (pl.) - A group of closely related orders. *Homo sapiens* is in the class Mammalia.

Family frequency among the Properties.

Fields included in the attached shapefile (Paracel_101890.richness_summary.*).

Field	Description
NMID	Unique sample number used by NatureMetrics
Sample_ID	Sample ID provided by client
Long	Longitude provided by client (decimal degrees)
Lat	Latitude provided by client (decimal degrees)
Property	Property at which sample was taken
Property_code	2-letter code for the Property
Taxa	Total number of taxa (OTUs) in the sample
Species	Total number of taxa identified to species in the sample
Fish	Total number of taxa identified as fish in the sample
Amphibian	Total number of taxa identified as amphibians in the sample
Bird	Total number of taxa identified as birds in the sample
Mammal	Total number of taxa identified as mammals in the sample
Reptile	Total number of taxa identified as reptiles in the sample
Redlist_NT_VU	Total number of Red List species detected in the sample (Near Threatened and Vulnerable categories)
NearThreatened	Total number of Near Threatened species detections in the sample
Vulnerable	Total number of Vulnerable species detections in the sample
Alouatta_caraya	Presence/absence of Alouatta caraya in the sample (NT)
Amazona_aestiva	Presence/absence of Amazona aestiva in the sample (NT)
Cabassous_chacoensis	Presence/absence of Cabassous chacoensis in the sample (NT)
Lontra_longicaudis	Presence/absence of Lontra longicaudis in the sample (NT)
Myrmecophaga_tridactyla	Presence/absence of Myrmecophaga tridactyla in the sample (VU)
Rhea_americana	Presence/absence of Rhea americana in the sample (NT)
Tapirus terrestris	Presence/absence of Tapirus terrestris in the sample (VU)
Tayassu_pecari	Presence/absence of Tayassu pecari in the sample (VU)

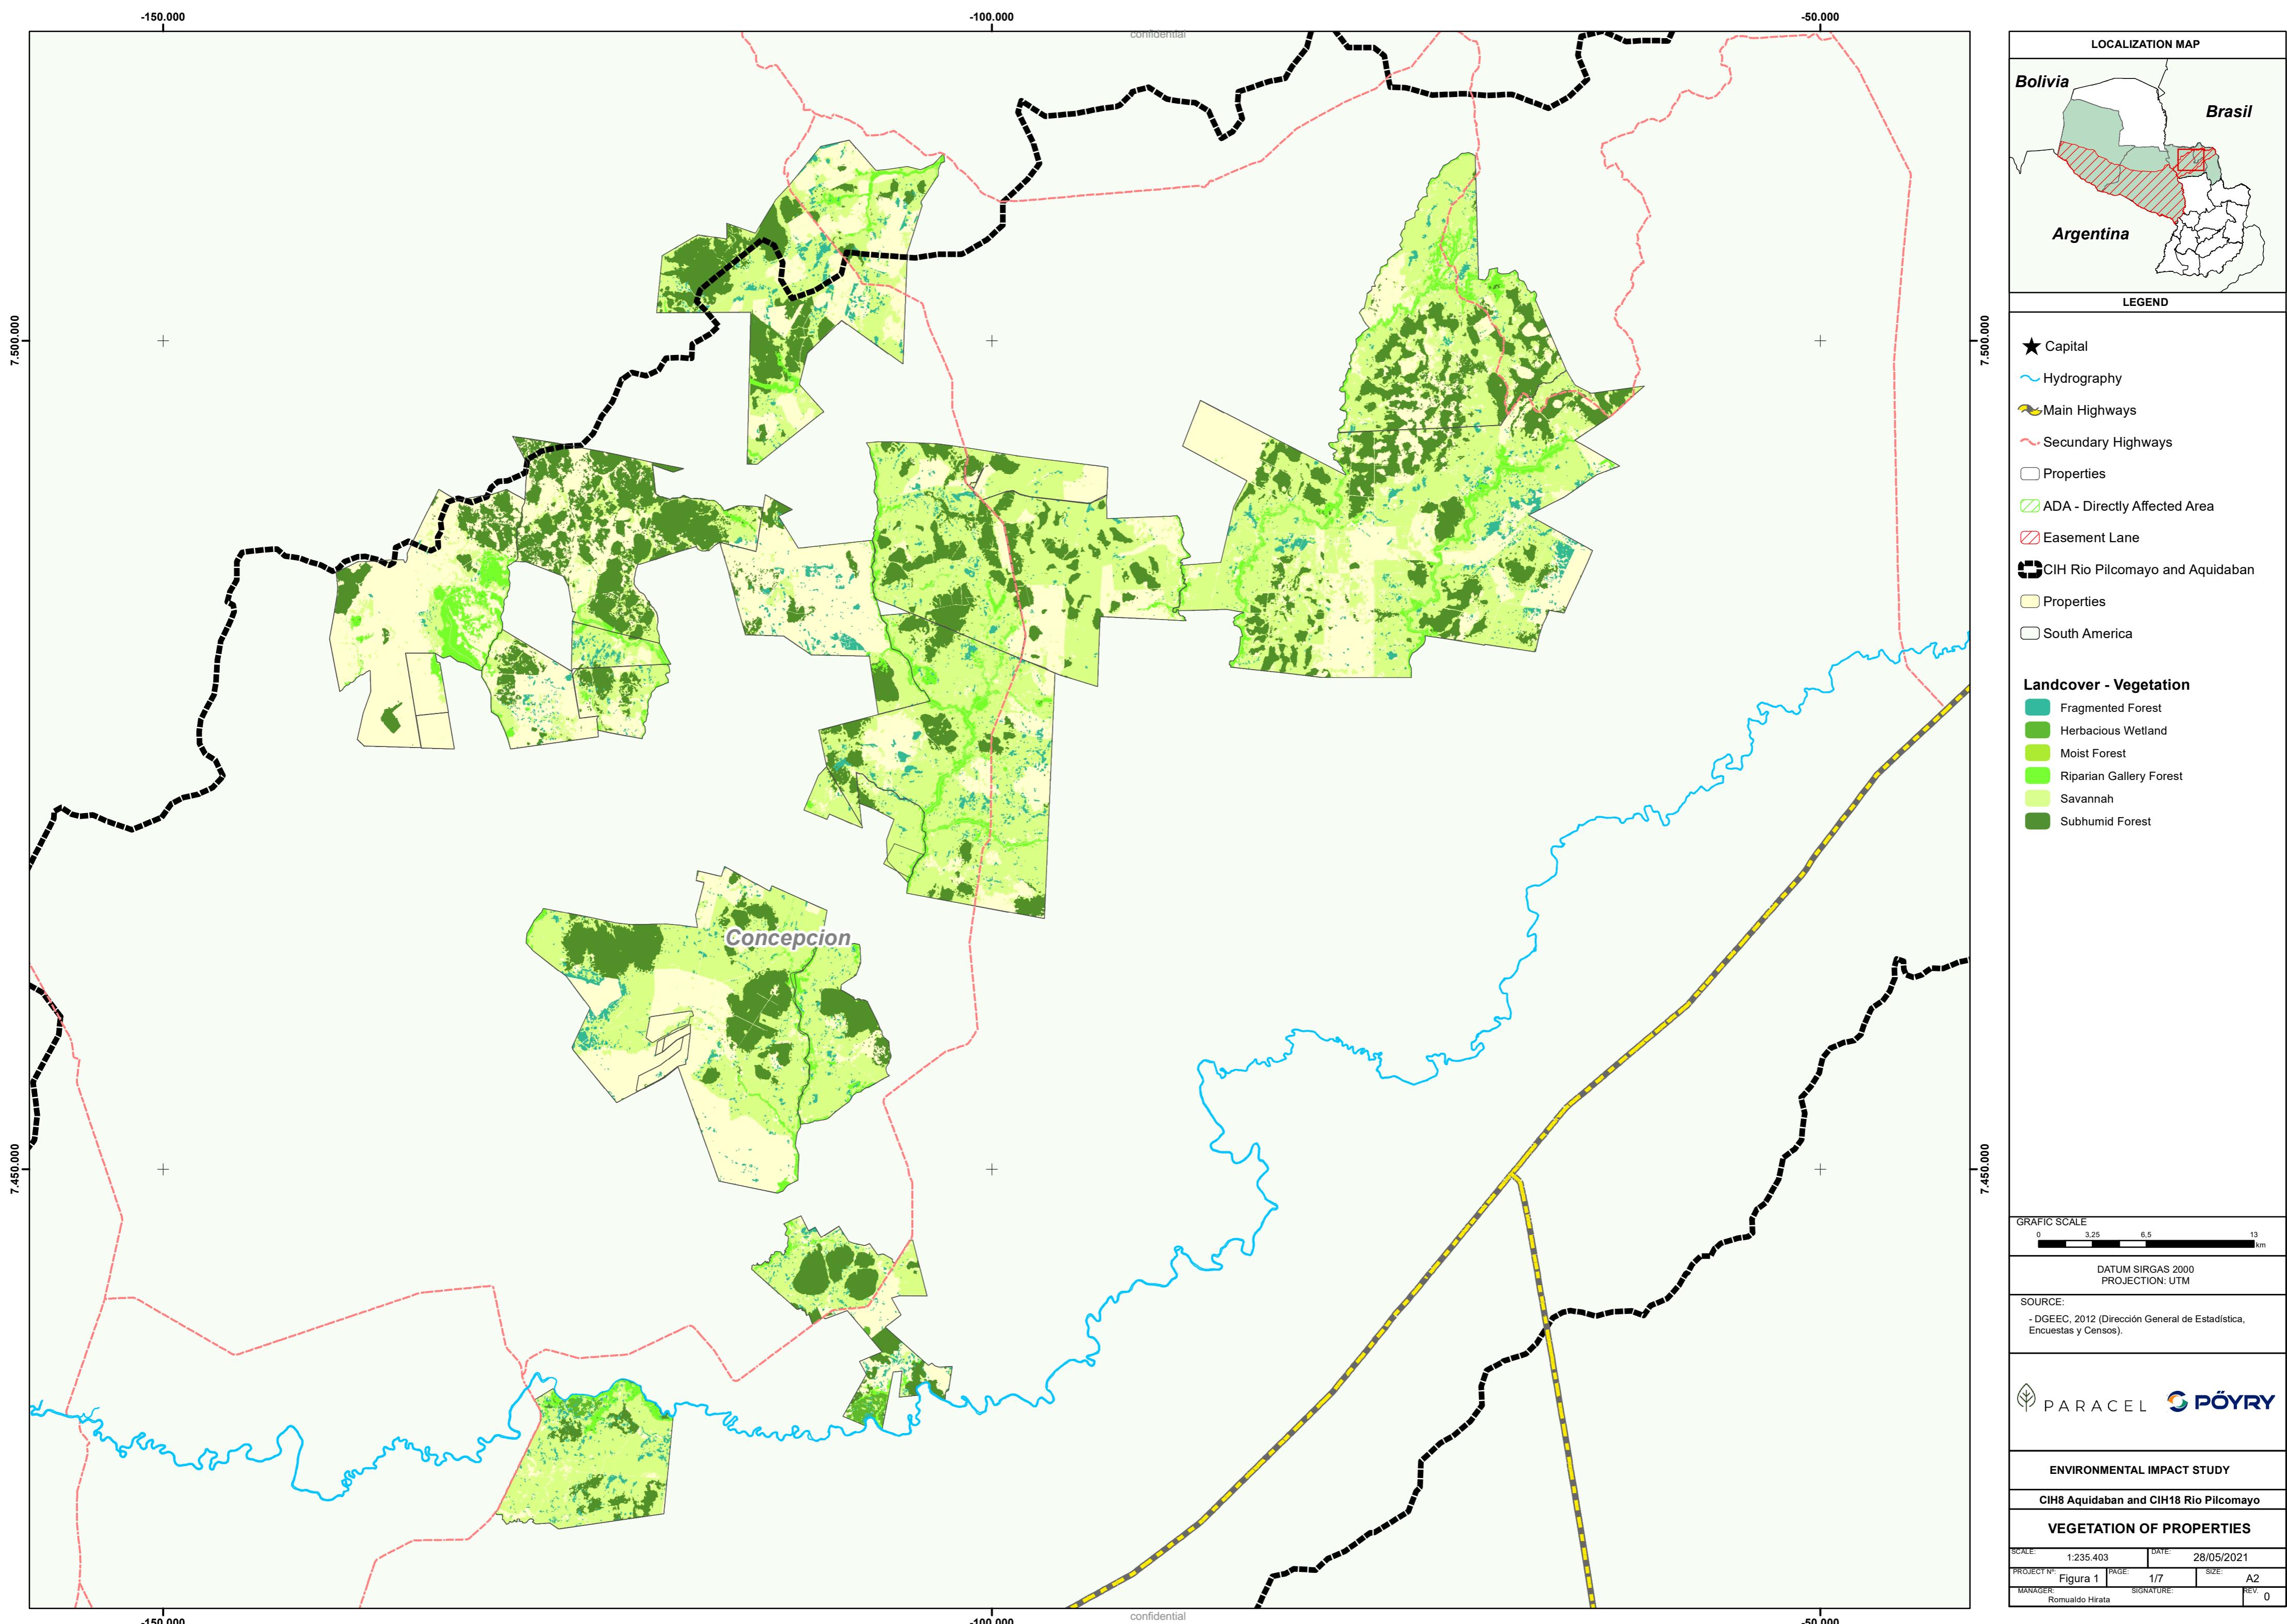

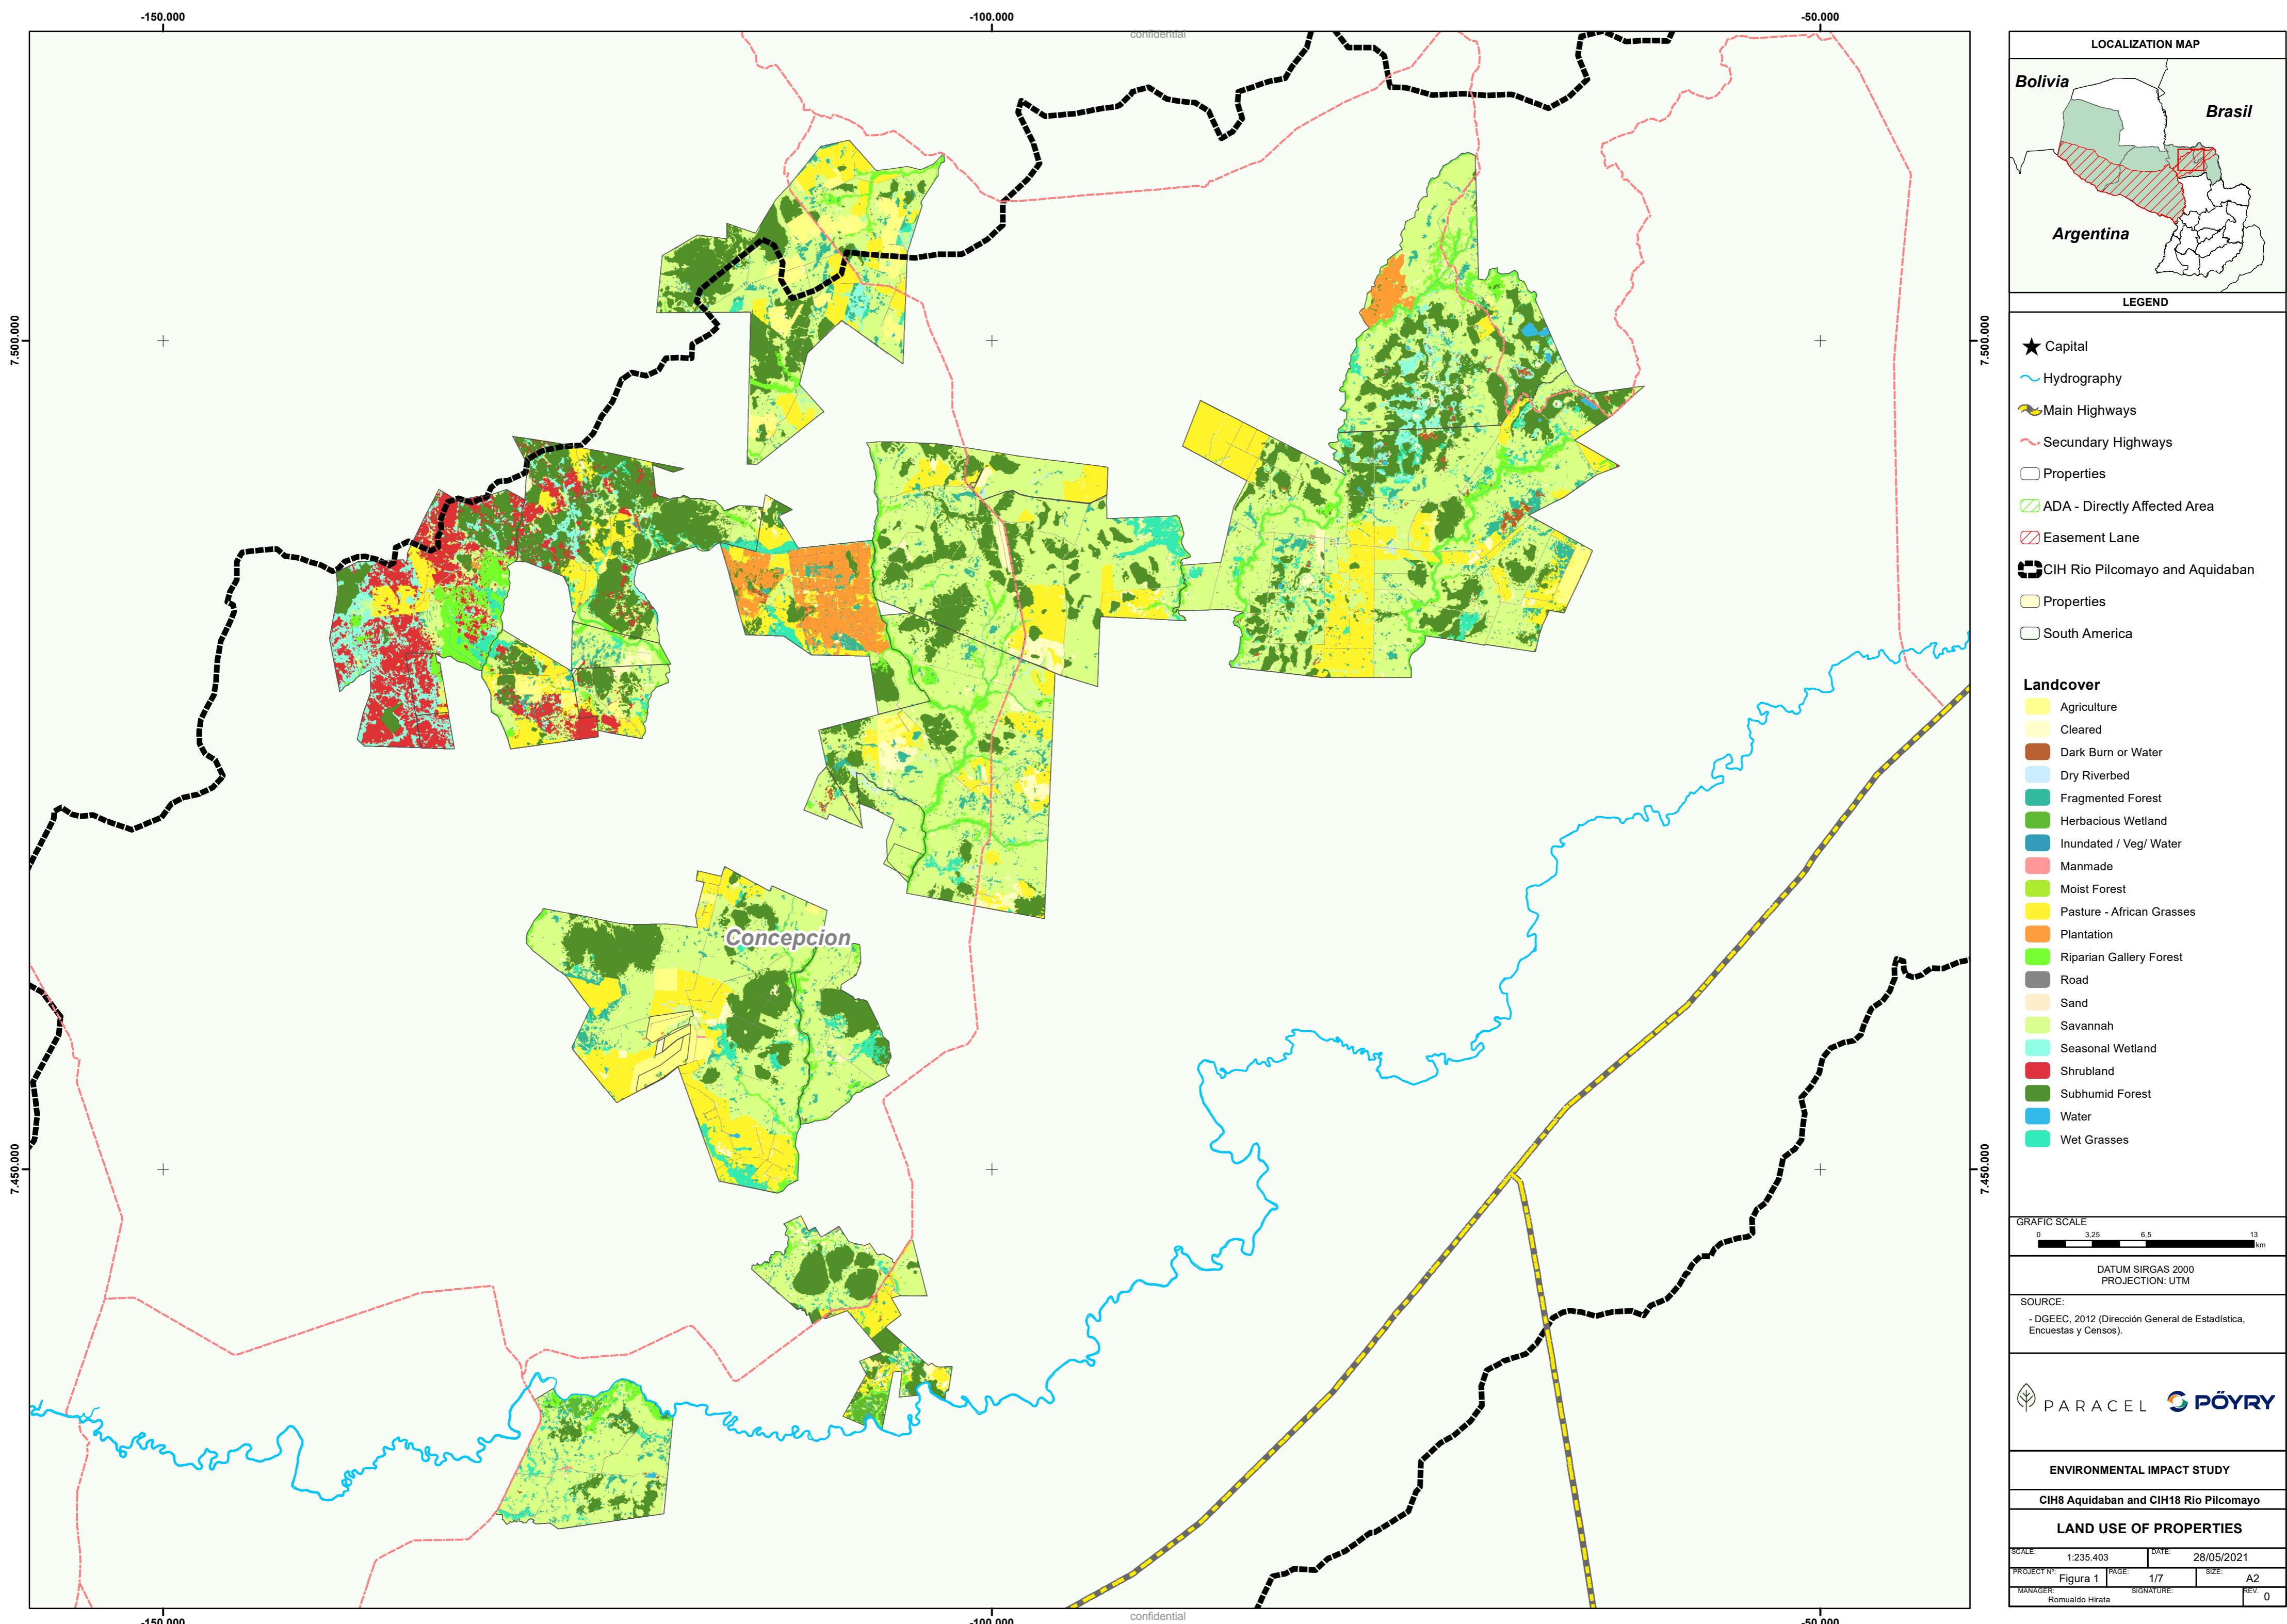

The volume of water filtered and the resultant concentration of purified DNA and index PCRs.
